Intended Audience

This User Manual is intended to be used in conjunction with the Quick Start User Guide included with the product, and is intended to provide additional information for more advanced product applications and usage. The reader should be familiar with the contents of the Quick Start User Guide, and in particular, should observe all safety warnings and installation guidelines contained therein.

General Information

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with all relevant legislation and codes of practice which apply in the country of use.

CE Marking

All esco antriebstechnik products intended for use within the European Union carry the CE mark to indicate compliance with European Directives. A declaration of conformity is available from the website, www.esco-antriebstechnik.de/EN

For compliance with the European EMC Directive, the necessary guidance is provided within this document and it is the responsibility of the installer to ensure this guidance is followed to ensure compliance.

UL Conformity

A list of currently listed products is available from the UL website, www.ul.com.

For compliance with UL requirements, the necessary guidance is provided within this document and it is the responsibility of the installer to ensure this guidance is followed to ensure compliance.

All rights reserved. No part of this User Guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by any information storage or retrieval system without permission in writing from the publisher.

2 Year Warranty

All escodrives units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

This user guide is the "original instructions" document. All non-English versions are translations of the "original instructions".

The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

This User Guide is for use with version 3.11 Firmware

User Guide Revision 2.02

esco antriebstechnik adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

When installing the drive on any power supply where the phase-ground voltage may exceed the phase-phase voltage (typically IT supply networks or Marine vessels) it is essential that the internal EMC filter ground and surge protection varistor ground (where fitted) are disconnected. If in doubt, refer to your Sales Partner for further information.

This manual is intended as a guide for proper installation, esco antriebstechnik cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This escodrives contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors tφ discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

1. Quick Start Up

1.1. Important Safety Information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

This variable speed drive product (escodrives) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The escodrives uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the escodrives, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the escodrives. Any electrical measurements required should be carried out with the escodrives disconnected.

Electric shock hazard! Disconnect and ISOLATE the escodrives before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

Danger: Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

Within the European Union, all machinery in which this product is used must comply with Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the escodrives control input functions – for example stop/start, forward/reverse and maximum speed is not sufficient for use in safety-critical applications without independent channels of protection.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The escodrives can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.

IP20 escodrives are intended for indoor use only.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive.

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the escodrives as delivered.

Never connect the mains power supply to the Output terminals

Do not install any type of automatic switchgear between the drive and the motor.

Wherever control cabling is close to power cabling, maintain a minimum separation of $100 \ \text{mm}$ and arrange crossings at 90 degrees. Ensure that all terminals are tightened to the appropriate torque setting.

Do not attempt to carry out any repair of the escodrives. In the case of suspected fault or malfunction, contact your local esco Sales Partner for further assistance.

1.2. Quick Start Process

itep	Action	See section	Page
1	Identify the Enclosure Type, Model Type and ratings of your drive from the model code on the label. In particular	2.1. Identifying the Drive by Model Number	8
	- Check the voltage rating suits the incoming supply		
	- Check the output current capacity meets or exceeds the full load current for the intended motor		
2	Unpack and check the drive. Notify the supplier and shipper immediately of any damage.		
3	Ensure correct ambient and environmental conditions for the drive are met by the proposed mounting location.	10.1. Environmental	42
4	Install the drive in a suitable cabinet (IP20 Units) ensuring suitable cooling air is available.	3.1. General 3.3. Mechanical Dimensions and Mounting – IP20	9
	Mount the drive to the wall or machine (IP66).	Open Units	
		3.4. Guidelines for Enclosure Mounting – IP20 Units	10
		3.5. Mechanical Dimensions – IP66 (NEMA 4X) Enclosed Units	11
		3.6. Guidelines for mounting (IP66 Units)	12
5	Select the correct power and motor cables according to local wiring regulations or code, noting the maximum permissible sizes	10.2. Rating Tables	42
6	If the supply type is IT or corner grounded, disconnect the EMC filter before connecting the supply.	10.4. EMC Filter Disconnect	43
7	Check the supply cable and motor cable for faults or short circuits.		
8	Route the cables		
9	Check that the intended motor is suitable for use, noting any precautions recommended by the supplier or manufacturer.	4.10. EMC Compliant Installation	19
10	Check the motor cable length does not exceed the maximum allowed for the drive unit - 100m (328ft) shielded cable maximum - 150m (293ft) unshielded cable maximum - 200m (656ft) shielded cable maximum with optional external output filter - 300m (984ft) unshielded cable maximum with optional external output filter		
11	Ensure wiring protection is providing, by installing a suitable circuit breaker or fuses in the incoming supply line	4.3.2. Fuse / Circuit Breaker Selection 10.2. Rating Tables	15 42
12	Connect the power cables, especially ensuring the protective earth connection is made	4.1. Connection Diagram 4.2. Protective Earth (PE) Connection 4.3. Incoming Power Connection 4.4. Motor Connection	14 15 15 16
13	Connect the control cables as required for the application	4.6. Control Terminal Wiring	16
. •	22 72 mil 22 mil 2 22 mil 3 24 mil 3 application	4.8. Control Terminal Connections	18
		4.10. EMC Compliant Installation	19
		7. Analog and Digital Input Macro Configurations	30
		7.2. Example Connection Diagrams	30
14	Thoroughly check the installation and wiring		
15	Ensure that all aspects of the installation comply with local codes and regulations relevant to the installation location		
16	Commission the drive parameters	5.1. Managing the Keypad	21
		6. Parameters	23

1.3. Installation Following a Period of Storage

Where the drive has been stored for some time prior to installation, or has remained without the main power supply present for an extended period of time, it is necessary to reform the DC capacitors within the drive according to the following table before operation. For drives which have not been connected to the main power supply for a period of more than 2 years, this requires a reduced mains voltage mains voltage to be applied for a time period, and gradually increased prior to operating the drive. The voltage levels relative to the drive rated voltage, and the time periods for which they must be applied are shown in the following table. Following completion of the procedure, the drive may be operated as normal.

Storage Period /Power-OFF Period	Initial Input Voltage Level	Time Period T1	Secondary Input Voltage Level	Time Period T2	Third Input Voltage Level	Time Period T3	Final Input Voltage Level	Time Period T4
Up to 1 Year	100%				N/A			
1 – 2 Years	100%	1 Hour			N/	'A		
2 – 3 Years	25%	30 Minutes	50%	30 Minutes	<i>7</i> 5%	30 Minutes	100%	30 Minutes
More than 3 Years	25%	2 Hours	50%	2 Hours	75%	2 Hours	100%	2 Hours

1.4. Quick Start Overview

Quick Start - IP20 & IP66 Non Switched

- Connect a Start / Stop switch between control terminals 1 & 2
 - o Close the Switch to Start
 - o Open to Stop
- Connect a potentiometer $(5k 10k\Omega)$ between terminals 5, 6 and 7 as shown
 - o Adjust the potentiometer to vary the speed from P-O2 (OHz default) to P-01 (50 / 60 Hz default)

Switch the mains power on to the unit using the built in isolator switch on the front panel.

NOTE: With single phase motors, forward rotation

The OFF/REV/FWD will enable the output.

only is possible.

2. General Information and Ratings

This chapter contains information about the escodrives EDS3 including how to identify the drive.

2.1. Identifying the Drive by Model Number

Each drive can be identified by its model number, as shown in the table below. The model number is on the shipping label and the drive nameplate. The model number includes the drive and any options.

2.2. Understanding the Rating Label

The product rating label provides the following information

	Key
0	Model Code
2	Enclosure Type and IP Rating
3	Firmware Version
4	Serial Number
6	Technical Data – Supply Voltage
6	Technical Data – Maximum continuous output current

On right hand side when viewed from the front.

2.3. Drive Model Numbers

Model	Number	kW	НР	Output Current	Frame Size
With Filter	Without Filter	KVV	nP	(A)	Frame Size
N/A	EDS3-110070-101#-01		0.5	7.0	1
N/A	EDS3-210105-104#-01		0.75	10.5	2
	200 - 240V + / - 10°	% - 1Phase Inp	ut – 1 Phase O	utput	
Model	Number	kW	НР	Output Current	Frame Size
With Filter	Without Filter	KVV	nr nr	(A)	Frame Size
EDS3-120043-1F1#-01	EDS3-120043-101#-01	0.37	0.5	4.3	1
EDS3-120070-1F1#-01	EDS3-120070-101#-01	0.75	1	7.0	1
EDS3-220105-1F4#-01	EDS3-220105-104#-01	1.1	1.5	10.5	2

For IP66 Switched Units, replace '#' with 'B'

3. Mechanical Installation

3.1. General

- The escodrives should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Sizes 1 and 2 only).
- Do not mount flammable material close to the escodrives.
- Ensure that the minimum cooling air gaps, as detailed in section 3.6. Guidelines for mounting (IP66 Units) and 3.7. Gland Plate and Lock Off are left clear.
- Ensure that the ambient temperature range does not exceed the permissible limits for the escodrives given in section 10.1. Environmental.
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the escodrives.

3.2. UL Compliant Installation

Refer to section 10.3. Additional Information for UL Compliance on page 43 for Additional Information for UL Compliance.

3.3. Mechanical Dimensions and Mounting – IP20 Open Units

Drive		A		3		С				E		F	We	ight
Size	mm	in	mm	in	mm	in	mm	in	mm	in	mm	in	Kg	Ib
1	173	6.81	83	3.27	123	4.84	162	6.38	50	1.97	50	1.97	1.0	2.2
2	221	8. <i>7</i> 0	110	4.33	150	5.91	209	8.23	63	2.48	63	2.48	1.7	3.8

Mounting Bolts						
Frame Size	Metric	UNF				
1 – 2	4 × M5	#8				

Tightening Torques							
Frame Size Required Torque Terminal Type							
Control Terminals	All	0.5 Nm	4.5 lb-in	Rising Clamp			
Power Terminals	1 – 2	0.8 Nm	7 lb-in	Screw Clamp			

3.4. Guidelines for Enclosure Mounting - IP20 Units

- IP20 drives are are designed to be installed in suitable enclosures to protect them from the environment.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the escodrives against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.
- The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. esco recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:

Drive Size	(Above 8	(& Below	Eithe	Y r Side	Z Between		Recommended airflow
	mm	in	mm	in	mm	in	CFM (ft3/min)
1	50	1.97	50	1.97	33	1.30	11
2	<i>7</i> 5	2.95	50	1.97	46	1.81	22

Dimension Z assumes that the drives are mounted side-by-side with no clearance.

Typical drive heat losses are 3% of operating load conditions. NOTE

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

3.5. Mechanical Dimensions – IP66 (NEMA 4X) Enclosed Units

Drive Size		A		В		e	D			=	We	ight
Drive Size	mm	in	mm	in	mm	in	mm	in	mm	in	kg	lb
1	232	9.13	161	6.34	162	6.37	189	7.44	148.5	5.85	2.3	5
2	257	10.12	188	7.4	182	7.16	200	7.87	176	7.00	3.5	7.7

Mounting Bolts								
Frame Size	Frame Size Metric UNF							
All Sizes	M4	#8						

Tightening Torques								
Frame Size Required Torque Terminal Type								
Control Terminals	All	0.5 Nm	4.5lb-in	Rising Clamp				
Power Terminals	1 - 2	0.8 Nm	7 lb-in	Rising Clamp				

3.6. Guidelines for mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1. Environmental.
- The drive must be mounted vertically, on a suitable flat surface.
- The minimum mounting clearances as shown in the table below must be observed.
- The mounting site and chosen mountings should be sufficient to support the weight of the drives.
- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling.
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are pre-moulded into the drive enclosure, recommended gland sizes are shown below. Gland holes for control cables may be cut as required.
- The mounting location should be free from vibration.
- Do not mount the drive in any area with excessive humidity, corrosive airborne chemicals or potentially dangerous dust particles.

 $\overline{\mathbf{x}}$

(|Y|)

- Avoid mounting close to high heat sources.
- The drive must not be mounted in direct sunlight. If necessary, install a suitable shade cover.
- The mounting location must be free from frost.
- Do not restrict the flow of air through the drive heatsink. The drive generates heat which must be naturally allowed to dissipate. Correct air clearance around the drive must be observed.
- If the location is subject to wide ambient temperature and air pressure variation, install a suitable pressure compensation valve in the drive gland plate.

NOTE If the drive has been in storage for a period longer than 2 years, the DC link capacitors must be reformed.

Drive Size	X Above	& Below	Y Either Side		
	mm	in	mm	in	
1	200	7.87	10	0.39	
2	200	7.87	10	0.39	

NOTE

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained within the limits shown in section 10.1. Environmental at all times.

3.7. Gland Plate and Lock Off

The use of a suitable gland system is required to maintain the appropriate IP / NEMA rating. The gland plate has pre moulded cable entry holes for power and motor connections suitable for use with glands as shown in the following table. Where additional holes are required, these can be drilled to suitable size. Please take care when drilling to avoid leaving any particles within the product.

Gland Plate Holes Sizes & Recommended glands

IP66 / NEMA 4X Gland Plate

 $\overrightarrow{\mathbf{x}}$

	Power	Control Cables				
Frame Size	Hole Size	Recommended Gland		Hala Cias	Recommended Gland	
	Hole Size	PG	Metric	Hole Size	PG	Metric
1	20.4mm / 0.8 inch	PG 13.5	M20	20.4mm /	PG 13.5	M20
2	27mm / 1.06 inch	PG21	M25	0.8 inch	PG 13.5	M20

- UL rated ingress protection ("Type") is only met when cables are installed using a UL recognized bushing or fitting for a flexible-conduit system which meets the required level of protection ("Type").
- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC.
- Not intended for installation using rigid conduit system.

Mains switch-disconnector Lock Off

On the switched models the mains switch-disconnector can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

IP66 / NEMA 4X Unit Lock Off

3.8. Removing the Terminal Cover

To access the connection terminals, the drive front cover needs to be removed as shown.

IP66 / NEMA 4X Units

Removing the screws on the front of the product allows access to the connection terminals, as shown below.

3.9. Routine Maintenance

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in section 10.1. Environmental.
- Heat sink fans (where fitted) freely rotating and dust free.
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

4. Power & Control Wiring

М	Digital Inputs	4.8.4	18

4.2. Protective Earth (PE) Connection

Grounding Guidelines

The ground terminal of each escodrives should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed), escodrives ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must conform to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically.

Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and or electrical codes.

Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The escodrives is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply:

- A Type B Device must be used.
- The device must be suitable for protecting equipment with a DC component in the leakage current.
- Individual ELCBs should be used for each escodrives.

Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

4.3. Incoming Power Connection

4.3.1. Cable Selection

- The mains power cables should be connected to L1/L, L2/N.
- For compliance with CE and C Tick EMC requirements, refer to section 4.10. EMC Compliant Installation on page 19.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between theescodrives and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Maximum dimensions are given in section 10.2. Rating Tables.

4.3.2. Fuse / Circuit Breaker Selection

- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 10.2. Rating Tables. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type J fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- The maximum permissible short circuit current at the escodrives Power terminals as defined in IEC60439-1 is 100kA.

4.3.3. Optional Input Choke

- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:
 - o The incoming supply impedance is low or the fault level / short circuit current is high.
 - o The supply is prone to dips or brown outs.
 - o The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

Supply	Frame Size	AC Input Inductor
110 & 230 Volt	1	on request
1 Phase	2	on request

4.4. Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply. For motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the escodrives U, and V terminals using a suitable 2 or 3 core cable. Where a 2 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 3 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the escodrives earth terminals.
- Maximum permitted motor cable length for all models: 100 meters shielded, 150 meters unshielded.
- Where multiple motors are connected to a single drive using parallel cables, an output choke MUST be installed.

4.5. Suitable Motor Types

escodrives E3 Single Phase Output is intended for use with the following motor types:

- PSC (Permanent Split Capacitor)
- Shaded Pole

The motor should be suitable for operation with a PWM inverter. If in doubt, consult the motor manufacturer for guidance - additional filtering may be required to prevent damage to the motor.

4.6. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm.
- Control Cable entry conductor size: 0.05 2.5mm² / 30 12 AWG.

4.7. Using the Selector Switch (Versions With Local Controls Only)

By adjusting the parameter settings the escodrives can be configured for multiple applications. This could typically be for Hand/Off/Auto applications (also known and Local/Remote) for HVAC and pumping industries. The integrated switch operates in parallel with drive terminal 2 (T2) and terminal 3 (T3) as digital input 1 and digital input 2. By default, the integrated switch is enabled.

4.7.1. Default functions of the control switches

	Switch Position		РОТ	Notes
Switch Left	STOP	Switch Right	Sets the output frequency	Factory Default Configuration. Switch Left or Switch Right with speed controlled from the Local POT.

4.7.2. Switch Configuration

407020000		migoranon						
P-64 = 0	DI1 =	T2 OR Switch Left OR Switch Right	+24V DC	VFD Control Terminals External User Switches	OR	Switch Left	OR	Switch Right

P-65 = 2	DI2 =	T3 AND Switch Left	+24V DC	VFD Control Terminals External User Switches	AND	Switch Left		

4.7.3. Using the Internal Pot (Local Control Versions Only)

On switched drives, the built-in pot (indicated) may be used to directly control the signal level applied to analog input 1, and therefore the output frequency (motor speed).

To select the built-in pot as the signal source for analog input 1, set P-16 = 8 In-pot.

4.8. Control Terminal Connections

Default Connections	Control Terminal	Signal	Description
			+24Vdc user output, 100mA.
2	1	+24Vdc User Output	Do not connect an external voltage source to this terminal.
	2	Digital Input 1	Positive logic
4	3	Digital Input 2	"Logic 1" input voltage range: 8V 30V DC "Logic 0" input voltage range: 0V 4V DC
<u> </u>	4	Digital Input 3 / Analog Input 2	Digital: 8 to 30V Analog: 0 to 10V, 0 to 20mA or 4 to 20mA
	5	+10V User Output	+10V, 10mA, 1kΩ minimum
7 0	6	Analog Input 1 / Digital Input 4	Analog: 0 to 10V, 0 to 20mA or 4 to 20mA Digital: 8 to 30V
<u> </u>	7	OV	0 Volt Common, internally connected to terminal 9
	8	Analog Output / Digital Output	Analog: 0 to 10V, Digital: 0 to 24V
	9	OV	0 Volt Common, internally connected to terminal 7
	10	Relay Common	
	11	Relay NO Contact	Contact 250Vac, 6A / 30Vdc, 5A

4.8.1. Analog Output

The analog output function may be configured using parameter P-25, which is described in section 6.2. Extended Parameters on page 25.

The output has two operating modes, dependent on the parameter selection:

- Analog Mode
 - o The output is a 0-10 volt DC signal, 20mA max load current.
- Digital Mode
 - o The output is 24 volt DC, 20mA max load current.

4.8.2. Relay Output

The relay output function may be configured using parameter P-18, which is described in section 6.2. Extended Parameters on page 24.

Two analog inputs are available, which may also be used as Digital Inputs if required. The signal formats are selected by parameters as follows:

- Analog Input 1 Format Selection Parameter P-16.
- Analog Input 2 Format Selection Parameter P-47.

These parameters are described more fully in section 6.2. Extended Parameters on page 24 and page 27.

The function of the analog input, e.g. for speed reference or PID feedback for example is defined by parameters P-15. The function of these parameters and available options is described in section 7. Analog and Digital Input Macro Configurations on page 30.

4.8.4. Digital Inputs

Up to four digital inputs are available. The function of the inputs is defined by parameters P-12 and P-15, which are explained in section 7. Analog and Digital Input Macro Configurations on page 30.

4.9. Motor Thermal Overload Protection

4.9.1. Internal Thermal Overload Protection

The drive has an in-built motor thermal overload function; this is in the form of an "l.t-trP" trip after delivering > 100% of the value set in P-08 for a sustained period of time (e.g. 150% for 60 seconds).

4.9.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:

Additional Information
Compatible Thermistor: PTC Type, 2.5kΩ trip level.
 Use a setting of P-15 that has Input 3 function as External Trip, e.g. P-15 = 3. Refer to section 7. Analog and Digital Input Macro Configurations on page 30 for further details.
■ Set P-47 = "Ptc-th"

Refer to section 7. Analog and Digital Input Macro Configurations for further information regarding configuration of the input functions.

4.10. EMC Compliant Installation

Category	Supply Cable Type	Motor Cable Type	Control Cables	Maximum Permissible Motor Cable Length
C16	Shielded ¹	Shielded ^{1,5}		1M / 5M ⁷
C2	Shielded ²	Shielded ^{1,5}	Shielded ⁴	5M / 25M ⁷
C3	Unshielded ³	Shielded ²		25M / 100M ⁷

- A screened (shielded) cable suitable for fixed installation with the relevant mains voltage in use. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals. Installation of a standard cable within a suitable steel or copper tube is also acceptable.
- ² A cable suitable for fixed installation with relevant mains voltage with a concentric protection wire. Installation of a standard cable within a suitable steel or copper tube is also acceptable.
- A cable suitable for fixed installation with relevant mains voltage. A shielded type cable is not necessary.
- A shielded cable with low impedance shield. Twisted pair cable is recommended for analog signals.
- The cable screen should be terminated at the motor end using an EMC type aland allowing connection to the motor body through the largest possible surface area. Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible. For IP66 drives, connect the motor cable screen to the internal ground clamp.
- Compliance with category C1 conducted emissions only is achieved. For compliance with category C1 radiated emissions, additional measures may be required, contact your Sales Partner for further assistance.
- Permissible cable length with additional external EMC filter.

4.11. Optional Brake Resistor

escodrives EDS3 Frame Size 2 and above units have a built in Brake Transistor. This allows an external resistor to be connected to the drive to provide improved braking torque in applications that require this.

The brake resistor should be connected to the "+" and "BR" terminals as shown.

The voltage level at these terminals may exceed 400VDC.

Stored charge may be present after disconnecting the mains power.

Allow a minimum of 10 minutes discharge after power off before attempting any connection to these terminals.

Suitable resistors and guidance on selection can be obtained from your esco Sales Partner. The brake transistor is enabled by setting P-34 > 0. See section 6.2. Extended Parameters on page 26 for more information.

Dynamic Brake Transistor with Thermal Overload Protection

It is highly recommended to equip the drive with a main contactor and provide and use an additional thermal overload protection for braking

The contractor should be wired so that it opens in case the resistor overheats, otherwise the drive will not be able to interrupt the main supply if the brake chopper remains closed (short-circuited) in a faulty situation.

It is also recommended to wire the thermal overload protection to a digital input of the drive as an External Trip.

> The voltage level at these terminals may exceed 400VDC.

Allow a minimum of 5 minutes discharge after power off before attempting any connection to these terminals.

5. Operation

5.1. Managing the Keypad

The drive is configured and its operation monitored via the keypad and display.

NAVIGATE	Used to display real-time information, to access and exit parameter edit mode and to store parameter changes.	
UP	Used to increase speed in real-time mode or to increase parameter values in parameter edit mode.	
DOWN	Used to decrease speed in real-time mode or to decrease parameter values in parameter edit mode.	
RESET / STOP	Used to reset a tripped drive. When in Keypad mode is used to Stop a running drive.	
START	When in keypad mode, used to Start a stopped drive.	

5.2. Operating Displays

5.3. Changing Parameters

5.4. Read Only Parameter Access

5.5. Resetting Parameters

To reset parameter values to their factory default settings, press and hold Up, Down and Stop buttons for > 2 seconds.

The display will show "P-dEF"

5.6. Resetting a Fault

5.7. LED Display

escodrives EDS3 has a built-in 6 Digit 7 Segment LED Display. In order to display certain warnings, the following methods are used:

5.7.1 LED Display Layout

5.7.2 LED Display Meanings

LED Segments	Behaviour	Meaning
a, b, c, d, e, f	Flashing all together	Overload, motor output current exceeds P-08
a and f	Flashing alternately	Mains Loss (Incoming AC power has been removed)
а	Flashing	Fire Mode Active

	frequency setpoint, and is disabled during constant speed operation. Analog Input 1 Scaling / Slave Speed Scaling	0.0	2000.0	100.0	%					
	Analog Input 1 Scaling. The analog input signal level is multiplied scaling factor is set to 200.0%, a 5 volt input will result in the drive runni Slave Speed Scaling. When operating in Slave Mode (P-12 = 9), multiplied by this factor, limited by the minimum and maximum speeds.	ing at maximum	frequency / spe	eed (P-01).						
P-36	Serial Communications Configuration		See B	elow						
	Index 1: Address	0	63	1	-					
	Index 2: Baud Rate	9.6	1000	115.2	kbps					
	Index 3: Communication loss protection	0	3000	t 3000	ms					
	This parameter has three sub settings used to configure the Modbus RT	U Serial Commu	nications. The S	ub Parameters o	are:					
	1st Index: Drive Address: Range: 0 – 63, default: 1.									
	2nd Index: Baud Rate & Network type: Selects the baud rate For Modbus RTU: Baud rates 9.6, 19.2, 38.4, 57.6, 115.2 kbps are available.		e for the interna	ıl RS485 commı	unication port.					
	For CAN: Baud rates 125, 250, 500 & 1000 kbps are available. 3rd Index: Watchdog Timeout: Defines the time for which the drive will operate without receiving a valid command telegrate after the drive has been enabled. This applies to Modbus RTU networks and bus networks (e.g. keypad control or Master Slave operation) only. CAN communication loss function is enabled via CAN objects 100Ch and 100Dh. Setting 0 disables the Watchdog timer. Setting a value of 30, 100, 1000, or 3000 defines the time limit in milliseconds for operation. A 'E' suffix selects on loss of communication. An 'r' suffix means that the drive will coast stop (output immediately disabled) but will not trip.									
P-37	Access Code Definition	0	9999	101						
P-37	Access Code Definition Defines the access code which must be entered in P-14 to access para			101						
P-37				0

6.3. P-00 Read Only Status Parameters

Par.	Description	Explanation
P00-01	1 st Analog input value (%)	100% = max input voltage
P00-02	2nd Analog input value (%)	100% = max input voltage
P00-03	Speed reference input (Hz / RPM)	Displayed in Hz if P-10 = 0, otherwise RPM
P00-04	Digital input status	Drive digital input status
P00-05	User PI output (%)	Displays value of the User PI output
P00-06	DC bus ripple (V)	Measured DC bus ripple
P00-07	Applied motor voltage (V)	Value of RMS voltage applied to motor
P00-08	DC bus voltage (V)	Internal DC bus voltage
P00-09	Heatsink temperature (°C)	Temperature of heatsink in °C
P00-10	Run time since date of manuf. (Hours)	Not affected by resetting factory default parameters
P00-11	Run time since last trip (1) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred. Reset also on next enable after a drive power down
P00-12	Run time since last trip (2) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred (under-volts not considered a trip) – not reset by power down / power up cycling unless a trip occurred prior to power down
P00-13	Trip Log	Displays most recent 4 trips with time stamp
P00-14	Run time since last disable (Hours)	Run-time clock stopped on drive disable, value reset on next enable
P00-15	DC bus voltage log (V)	8 most recent values prior to trip, 256ms sample time
P00-16	Heatsink temperature log (°C)	8 most recent values prior to trip, 30s sample time
P00-17	Motor current log (A)	8 most recent values prior to trip, 256ms sample time
P00-18	DC bus ripple log (V)	8 most recent values prior to trip, 22ms sample time
P00-19	Internal drive temperature log (°C)	8 most recent values prior to trip, 30 s sample time
P00-20	Internal drive temperature (°C)	Actual internal ambient temperature in °C
P00-21	CAN process data input	Incoming process data (RX PDO 1) for CAN: Pl 1, Pl 2, Pl 3, Pl 4
P00-22	CAN process data output	Outgoing process data (TX PDO1) for CAN: PO1, PO2, PO3, PO4
P00-23	Accumulated time with heatsink > 85°C (Hours)	Total accumulated hours and minutes of operation above heatsink temp of 85°C
P00-24	Accumulated time with drive internal temp > 80°C (Hours)	Total accumulated hours and minutes of operation with drive internal ambient above 80°C
P00-25	Estimated rotor speed (Hz)	In vector control modes, estimated rotor speed in Hz
P00-26	kWh meter / MWh meter	Total number of kWh / MWh consumed by the drive
P00-27	Total run time of drive fans (Hours)	Time displayed in hh:mm:ss. First value displays time in hrs, press up to display mm:ss
P00-28	Software version and checksum	Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates power stage
P00-29	Drive type identifier	Drive rating, drive type and software version codes
P00-30	Drive serial number	Unique drive serial number
P00-31	Motor current Id / Iq	Displays the magnetising current (Id) and torque current (Iq). Press UP to show Iq

Par.	Description	Explanation
P00-32	Actual PWM switching frequency (kHz)	Actual switching frequency used by drive
P00-33	Critical fault counter – O-l	These parameters log the number of times specific faults or errors occur, and are
P00-34	Critical fault counter – O-Volts	useful for diagnostic purposes
P00-35	Critical fault counter – U-Volts	
P00-36	Critical fault counter – O-temp (h/sink)	These parameters log the number of times specific faults or errors occur, and are
P00-37	Critical fault counter – b O-l (chopper)	useful for diagnostic purposes
P00-38	Critical fault counter – O-hEAt (control)	
P00-39	Modbus comms error counter	
P00-40	CANbus comms error counter	
P00-41	I/O processor comms errors	
P00-42	Power stage uC comms errors	
P00-43	Drive power up time (life time) (Hours)	Total lifetime of drive with power applied
P00-44	Phase U current offset & ref	Internal value
P00-45	Phase V current offset & ref	Internal value
P00-46	Phase W current offset & ref	Internal value
P00-47	Index 1: Fire mode total active time Index 2: Fire Mode Activation Count	Total activation time of Fire Mode Displays the number of times Fire Mode has been activated
P00-48	Scope channel 1 & 2	Displays signals for first scope channels 1 & 2
P00-49	Scope channel 3 & 4	Displays signals for first scope channels 3 & 4
P00-50	Bootloader and motor control	Internal value

6.4. Single Phase Motor - Boost Starting cycle

In order to provide a reliable method for starting the motor, a special technique is used. The motor is started immediately at rated frequency, whilst the voltage is ramped from an initial Boost Voltage (set in P-11) to the Motor Rated Voltage (set in P-07) over a Boost Period Duration (set in P-33). Following the starting boost period, the drive then begins to control the output frequency and speed of the motor. The graphs below show how this operation works.

In order to achieve reliable starting and optimise the starting method, the following procedure can be used.

- 1. The motor must be correctly connected to the drive and safe to operate before using this procedure.
- 2. Ensure the motor rated voltage (P-07) and current (P-08) have been correctly programmed in the drive parameters.
- **3.** Select Extended Parameter Access by setting P-14 = 101.
- 4. Set the Boost Period Duration P-33 to the maximum allowed value of 150 seconds.
- 5. Start the drive, and display the motor current (press the Navigate button until the display shows "A x.x" where x is the motor current).
- **6.** Check the current value compared to the motor rated current around 3-5 seconds after starting the drive.
- a. If the current displayed is less than 80% of the motor rated current:
 - o Stop the drive
 - o Increase P-11
 - o Repeat from step 5.

- **b.** If the current displayed is greater than 90% of the motor rated current.
 - o Stop the drive
 - o Reduce P-11
 - o Repeat from step 5.
- 7. The correct boost voltage setting should deliver 80 90% of the motor rated current approximately 3 5 seconds after enabling
- 8. Now the Boost Period Duration may be reduced to match the actual time required for the motor to start. The simplest method is to initially reduce in large steps and monitor the motor behaviour on starting the drive. The ideal boost period will be a few seconds longer than is required to bring the motor to full speed.

By following this procedure, the motor starting parameter can be optimised to start the motor reliably without excessive starting current.

7. Analog and Digital Input Macro Configurations

7.1. Overview

escodrives EDS3 uses a Macro approach to simplify the configuration of the Analog and Digital Inputs. There are two key parameters which determine the input functions and drive behaviour:

- Selects the main drive control source and determines how the output frequency of the drive is primarily controlled.
- Assigns the Macro function to the analog and digital inputs.

Additional parameters can then be used to further adapt the settings, e.g.

- Used to select the format of the analog signal to be connected to analog input 1, e.g. 0 10 Volt, 4 20mA.
- Determines whether the drive should automatically start following a power on if the Enable Input is present.
- When Keypad Mode is selected, determines at what output frequency / speed the drive should start following the enable command, and also whether the keypad start key must be pressed or if the Enable input alone should start the drive.
- P-47 Used to select the format of the analog signal to be connected to analog input 2, e.g. 0 10 Volt, 4 20mA.

7.2. Example Connection Diagrams

The diagrams below provide an overview of the functions of each terminal macro function, and a simplified connection diagram for each.

7.3. Macro Functions Guide Key

The table below should be used as a key on the following pages.

	l
Function	Explanation
STOP	Latched Input, Open the contact to STOP the drive
RUN	Latched input, Close the contact to Start, the drive will operate as long as the input is maintained
FWD℃	Latched Input, selects the direction of motor rotation FORWARD
RUN FWDひ	Latched Input, Close to Run in the FORWARD direction, Open to STOP
ENABLE	Hardware Enable Input.
	In Keypad Mode, P-31 determines whether the drive immediately starts, or the keypad start key must be pressed.
	In other modes, this input must be present before the start command is applied via the fieldbus interface.
START 1	Normally Open, Rising Edge, Close momentarily to START the drive (NC STOP Input must be maintained)
^- START -^	Simultaneously applying both inputs momentarily will START the drive (NC STOP Input must be maintained)
STOP☐	Normally Closed, Falling Edge, Open momentarily to STOP the drive
START 1 FWD ひ	Normally Open, Rising Edge, Close momentarily to START the drive in the forward direction (NC STOP Input must be maintained)
^-FAST STOP (P-24)-^	When both inputs are momentarily active simultaneously, the drive stops using Fast Stop Ramp Time P-24
FAST STOP ☐ (P-24)	Normally Closed, Falling Edge, Open momentarily to FAST STOP the drive using Fast Stop Ramp Time P-24
E-TRIP	Normally Closed, External Trip input. When the input opens momentarily, the drive trips showing E-Er iP or PEc-Eh depending on P-47 setting
Fire Mode	Activates Fire Mode
Analog Input All	Analog Input 1, signal format selected using P-16
Analog Input AI2	Analog Input 2, signal format selected using P-47
All REF	Analog Input 1 provides the speed reference
AI2 REF	Analog Input 2 provides the speed reference
P-xx REF	Speed reference from the selected preset speed
PR-REF	Preset speeds P-20 – P-23 are used for the speed reference, selected according to other digital input status
PI-REF	PI Control Speed Reference
PI FB	Analog Input used to provide a Feedback signal to the internal PI controller
KPD REF	Keypad Speed Reference selected
FB REF	Selected speed reference from Fieldbus (Modbus RTU / CAN Open / Master depending on P-12 setting)
(NO)	Input is Normally Open, Close momentarily to activate the function
(NC)	Input is Normally Closed, Open momentarily to activate the function
INC SPD 1	Normally Open, Rising Edge, Close momentarily to increase the motor speed by value in P-20
DEC SPD ☐	Normally Open, Rising Edge, Close momentarily to decrease the motor speed by value in P-20

7.8. Fire Mode

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation. The Fire Mode input may be a normally open (Close to Activate Fire Mode) or Normally Closed (Open to Activate Fire Mode) according to the setting of P-30 Index 2. In addition, the input may be momentary or maintained type, selected by P-30 Index 3.

This input may be linked to a fire control system to allow maintained operation in emergency conditions, e.g. to clear smoke or maintain air quality within that building.

The fire mode function is enabled when P-15 = 15, 16, 17, or 18, with Digital Input 3 assigned to activate fire mode.

Fire Mode disables the following protection features in the drive:

O-t (Heat-sink Over-Temperature), U-t (Drive Under Temperature), Th-FLt (Faulty Thermistor on Heat-sink), E-trip (External Trip), 4-20 F (4-20mA fault), Ph-Ib (Phase Imbalance), P-Loss (Input Phase Loss Trip), SC-trp (Communications Loss Trip), I.t-trp (Accumulated overload Trip).

The following faults will result in a drive trip, auto reset and restart:

O-Volt (Over Voltage on DC Bus), U-Volt (Under Voltage on DC Bus), h O-I (Fast Over-current Trip), O-I (Instantaneous over current on drive output), Out-F (Drive output fault, Output stage trip).

8. Modbus RTU Communications

8.1. Introduction

The escodrives E3 can be connected to a Modbus RTU network via the RJ45 connector on the front of the drive.

8.2. Modbus RTU Specification

Protocol	Modbus RTU
Error check	CRC
Baud rate	9600bps, 19200bps, 38400bps, 57600bps, 115200bps (default)
Data format	1 start bit, 8 data bits, 1 stop bits, no parity
Physical signal	RS 485 (2-wire)
User interface	RJ45
Supported Function Codes	03 Read Multiple Holding Registers
	06 Write Single Holding Register
	16 Write Multiple Holding Registers (Supported for registers 1 – 4 only)

8.3. RJ45 Connector Configuration

For full MODBUS RTU register map information please refer to your esco Sales Partner. Local contacts can be found by visiting our website:

www.esco-antriebstechnik.de/EN

RS485+ RS485-0 Volt / Common Ground

When using MODBUS control the Analog and Digital Inputs can be configured as shown in section 7.6. Macro Functions - Fieldbus Control Mode (P-12 = 3, 4, 7, 8 or 9).

1	CAN -
2	CAN+
3	O Volts
4	-RS485 (PC)
5	+RS485 (PC)
6	+24 Volt
7	-RS485 (Modbus RTU)
8	+RS485 (Modbus RTU)

Warning: This is not an Ethernet connection. Do not connect directly to an Ethernet port.

NOTES

- Use 3 or 4 Conductor Twisted Pair Cable
- RS485+ and RS485- must be twisted pair
- Ensure the network taps for the drive are kept as short as possible
- Using Option OPT-2-BNTSP-IN is preferred
- Terminate the network cable shield at the controller only. Do not terminate at the drive!
- O Volt common must be connected across all devices and to reference 0 Volt terminal at the controller
- Do not connect the OV Common of the network to power ground

8.4. Modbus Register Map

Register			Supported Function Codes		ed odes	Function	Danas	Explanation

2011	-	R	~			Analog Output		0.0 to 100.0%
2012	P00-05	R	~			PI Output		0.0 to 100.0%
2013	P00-20	R	~			Internal Temperature		Temperature in °C
2014	P00-07	R	•			Motor Output Voltage		0 – 500V
2015	-	R	•			IP66 Pot Input value		0 ~ 4096 (12bits)
2016	-	R	~			Trip Code		See user guide for code definition

All user configurable parameters are accessible as Holding Registers, and can be Read from or Written to using the appropriate Modbus command. The Register number for each parameter P-04 to P-60 is defined as 128 + Parameter number, e.g. for parameter P-15, the register number is 128 + 15 = 143. Internal scaling is used on some parameters, for further details please contact your esco Sales Partner.

8.4.1. Drive status and error code Word PDIO

Bit	Function When "0"	Function When "1"						
15								
14								
13								
12	In the event of a trip,	the associated code						
11	is shown i	is shown in this byte						
10								
9								
8								
7								
6	Not Ready	Drive Ready						
5								
4								
3								
2	-	Drive In Standby Mode						
1	Drive OK	Drive Tripped						
0	Drive Stopped	Drive Running						

Bit 6: Drive Ready to Run is defined as:

- Not tripped.
- Hardware enable signal present (DI1 ON).
- No mains loss condition.

8.4.2. Register 2001 definition – New Status Word

Bit	Definition	Description
0	Ready	This bit is set if no trip and no mains loss, plus hardware enabled
1	Running	This bit is set when drive is running
2	Tripped	This bit is set when drive is under trip condition
3	Standby	This bit is set when drive is in standby mode
4	Fire Mode	This bit is set if fire mode is active
5	Reserved	Read as O
6	Speed Set-point Reached (At Speed)	This bit is set when drive is enabled and reaches speed set point
7	Below Minimum Speed	This bit is set when drive is enabled and speed less than P-O2
8	Overload	This bit is set if motor current > P-08
9	Mains Loss	This bit is set if mains loss condition happens
10	Heatsink > 85°C	This bit is set if drive heatsink temperature over 85°C
11	Control Board > 80°C	This bit is set if control PCB temperature over 80°C
12	Switching Frequency Reduction	This bit is set if PWM switching frequency foldback is active
13	Reverse Rotation	This bit is set when motor is in reverse rotation (negative speed)
14	Reserved	Read as O
15	Live Toggle Bit	This bit will toggle each time this register is read

8.4.3. Register 2005 definition – IO Status Word

Bit	Definition	Description
0	DI1 Status	This bit is set when digital input 1 is closed
1	DI2 Status	This bit is set when digital input 2 is closed
2	DI3 Status	This bit is set when digital input 3 (Al-2) is closed
3	DI4 Status	This bit is set when digital input 4 (Al-1) is closed
4, 5	Reserved	Read as O
6	IP66 Switch FWD	This bit is set when IP66 FWD switch is closed
7	IP66 Switch REV	This bit is set when IP66 REV switch is closed
8	Digital Output Status	This bit is set when digital output is active(24V) or Analog output > 0
9	Relay Output Status	This bit is set when user relay is closed
10, 11	Reserved	Read as O
12	Analog Input 1 Signal Lost (4-20mA)	This bit is set when analog input 1 signal loss happens (420mA)
13	Analog Input 2 signal Lost (4-20mA)	This bit is set when analog input 2 signal loss happens (420mA)
14	Reserved	Read as O
15	IP66 Pot Input > 50%	This bit is set when IP66 integrated pot input value > 50%

9. CAN Communication

9.1. CAN Communication

The CAN communication profile in the escodrives EDS3 is implemented according to the specification DS301 version 4.02 of CAN in automation (www.can-cia.de). Specific device profiles such as DS402 are not supported.

The CAN communication function is enabled by default after power up. However in order to use any control functions through CAN, the following setting is required: P-12 = 7 or 8.

The CAN communication baud rate can be set by using parameter P-36 (Index 2). Available baud rates are: 125kbps, 250kbps, 500kbps, 1 Mbps. (with default setting as 500kbps).

The Node ID is set up through drive address parameter P-36 (Index 1) with the default value of 1.

The tables below show the Index and Sub Index required to address each parameter. All User Adjustable parameters are accessible by CAN, except those that would directly affect the communications.

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters may not be changed whilst the drive is enabled.

escodrives EDS3 provides the following default COB-ID and functions:

Туре	COB-ID	Function
NMT	000h	Network management.
Sync	080h	Synchronous message. COB-ID can be configured to other value.
Emergency	080h + Node address	Emergency message.
PDO1 (TX)	180h + Node address	Process data object.
PDO1 (RX)	200h + Node address	PDO1 is pre-mapped and enabled by default.
PDO2 (TX)	280h + Node address	COB-ID can be configured to other value. PDO2 is pre-mapped and disabled by default.
PDO2 (RX)	300h + Node address	Transmission mode, COB-ID and mapping can be configured.
SDO (TX)	580h + Node address	
SDO (RX)	600h + Node address	SDO channel can be used for drive parameter access.
Error Control 700h + Node address		Guarding and Heartbeat function are supported. COB-ID can be configured to other value.

NOTE

- The escodrives EDS3 SDO channel only supports expedited transmission.
- The escodrives EDS3 can only support up to 2 Process Data Objects (PDO). All PDOs are pre-mapped; however PDO2 is disabled by default. The table below gives the default PDO mapping information.
- Customer configuration (mapping) will NOT be saved during power down. This means that the CANopen configuration will restore to its default condition each time the drive is powered up.

9.1.1. PDO Default Mapping

	Objects No.	Mapped Object Length Mapped Function		Transmission Type		
	1	1 2000h Unsigned 16 Control command re		Control command register*		
RX	2	2001 h	Integer 16	Speed reference	254	
PDO1	3 2003h Unsigned 16 User ramp reference		User ramp reference	Valid immediately		
	4	0006h	6h Unsigned 16 Dummy			
	1	200Ah	Unsigned 16	Drive status register		
TX	2	200Bh	Integer 16	Motor speed Hz	254	
PDO1	3 200Dh Unsigno		Unsigned 16	Motor current	Send after receiving RX PDO 1	
	4	2010h	Integer 16	Drive temperature		

	Objects No.	Mapped Object	Length	Mapped Function	Transmission Type	
	1	0006h	Unsigned 16	Dummy		
RX	2	0006h	Unsigned 16	Dummy	254	
PDO2	3	0006h	Unsigned 16	Dummy	254	
	4	0006h	Unsigned 16	Dummy		
]	2011 h	Unsigned 16	DC bus voltage		
TX	2	2012h	Unsigned 16	Digital input status	254	
PDO2	3	2013h	Integer 16	Analog input 1 (%)	254	
	4	2014h	Integer 16	Analog input 2 (%)		

^{*} Drive control can only be achieved when P-12=7 or 8 provided that P-31 = 0, 1, 4 or 5.

9.1.2. PDO transmission type

Various transmission modes can be selected for each PDO. For RX PDO, the following modes are supported:

Transmission Type	Mode	Description
0 – 240	Synchronous	The received data will be transferred to the drive active control register when the next sync message is received.
254, 255	Asynchronous	The received data will be transferred to the drive active control register immediately without delay.

For TX PDO, the following modes are supported:

Transmission Type	Mode	Description
0	Acyclic synchronous	TX PDO will only be sent out if the PDO data has changed and PDO will be transmitted on reception of SYNC object.
1-240		TX PDO will be transmitted synchronously and cyclically. The transmission type indicates the number of SYNC object that are.
254	Asynchronous	TX PDO will only be transferred once corresponding RX PDO has been received.
255 Asynchronous		TX PDO will only be transferred anytime if PDO data value has changed.

9.1.3. CAN Open Specific Object Table

9.2. Additional Information Relating to CAN or Modbus or Both

9.2.1 Drive Control Word Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	High byte										Low	byte			

Bit 0: Run/Stop command: Set to 1 to enable the drive. Set to 0 to stop the drive.

Bit 1: Fast stop request. Set to 1 to enable drive to stop with 2nd deceleration ramp.

Bit 2: Reset request. Set to 1 in order to reset the drive if drive is under trip condition.

User must clear this bit when drive is under normal condition to prevent un-expected reset.

Coast stop request. Set to 1 to issue a coast stop command.

For normal operation, Bit 3 has the highest priority, bit 0 has the lowest priority (bit 3>bit 1>bit 0). For example if user set command as 0x0009, drive will do a coast stop rather than run. For normal run/start, just set this register to 1.

NOTE Start/stop (bit 0), fast stop (bit 1) and coast stop (bit 3) only works if P-31=0 or 1. Otherwise, start/stop function is controlled by drive control terminals. Reset function (bit 2) works all the time as long as drive is operated under Modbus control mode (P-12=3 or 4).

9.2.2 Speed Reference Format

Speed reference value is transferred with one decimal place (200 = 20.0Hz). The maximum speed reference value is limited by P-01. Either register 2 or register 5 can be used for speed reference control, however only one reference should be used in any control system, otherwise unexpected behaviour can result.

9.2.3 Acceleration / Deceleration Ramp Time

Active only when P-12 = 4, this register specifies the drive acceleration and deceleration ramp time. The same value is applied simultaneously to the acceleration and deceleration ramp times. The value has two decimal places, e.g. 500 = 5.00 seconds.

9.2.4 Drive status and error code Word

High byte gives drive error code. (Valid when the drive is tripped, see 11.1. Fault Code Messages for further details) Low byte gives drive status information as follows:

Bit 0: O = Drive Stopped, 1 = Drive Running

Bit 1: 0 = OK, 1 = Drive Tripped

Bit 5: 0 = OK, 1 = In Standby Mode

Bit 6: O = Not Ready, 1 = Drive Ready to Run (not tripped, hardware enabled and no mains loss condition)

10. Technical Data

10.1. Environmental

: -10 ... 50°C (frost and condensation free) Operational ambient temperature range Open Drives

> : -20 ... 40°C (frost and condensation free) Enclosed Drives

: -40 ... 60°C Storage ambient temperature range

Maximum altitude : 2000m. Derate above 1000m: 1% / 100m Open Drives

> : 2000m. Derate above 1000m: 2.5% / 100m Enclosed Drives

Maximum humidity : 95%, non-condensing

Environmental Conditions IP20 escodrives EDS3 : Designed to operate in 3S2/3C2 environments in accordance

with IEC 60721-3-3.

IP66 escodrives EDS3 : Designed to operate in 3S3/3C3 environments in accordance

with IEC 60721-3-3.

NOTE For UL compliance: the average ambient temperature over a 24 hour period for 200-240V, 2.2kW and 3HP, IP20 drives is 45°C.

10.2. Rating Tables

Frame Size	kW	HP	Input Current	Fuse / MC	B (Type B)	Maximum Cable Size		Output Current	Recommended Brake Resistance
				Non UL	UL	mm²	AWG	A	Ω
110 - 115 (+ / - 10%) V 1 Phase Input, 1 Phase Output									
1	0.37	0.5	8.5	16	15	8	8	7.0	-
2	0.75	1	12.5	16	15	8	8	10.5	100
200 - 240 (+/-109	%) V 1 P	hase Input,	1 Phase Out	tput				
1	0.37	0.5	6.0	10	10	8	8	4.3	-
1	0.75	1	9.3	16	15	8	8	7.0	-
2	1.1	1.5	14.0	20	20	8	8	10.5	100

NOTE Cable sizes shown are the maximum possible that may be connected to the drive. Cables should be selected according to local wiring codes or regulations at the point of installation.

10.3. Additional Information for UL Compliance

escodrives EDS3 is designed to meet the UL requirements. For an up to date list of UL compliant products, please refer to UL listing NMMS.E494838. In order to ensure full compliance, the following must be fully observed.

Input Power Supply Requirements								
Supply Voltage	110 – 115 RMS Volts for 115 Volt rated units, + /- 10% variation allowed. 115 Volt RMS Maximum.							
	200 – 240 RMS Volts for 230 Volt rated units, + /- 10% variation allowed. 240 Volt RMS Maximum.							
Frequency	50 – 60Hz + / - 5% Variation							
Short Circuit Capacity	Voltage Rating	Min kW (HP)	Max kW (HP)	Maximum supply short-circuit current				
	115V	0.37 (0.5)	0.75 (1)	100kA rms (AC)				
	230V 0.37 (0.5) 1.1 (1.5) 100kA rms							
	All the drives in the above table are suitable for use on a circuit capable of delivering not more than the above specified maximum short-circuit Amperes symmetrical with the specified maximum supply voltage when protected by Class J fuses.							

Mechanical Installation Requirements

All escodrives EDS3 units are intended for indoor installation within controlled environments which meet the condition limits shown in section 10.1. Environmental.

The drive can be operated within an ambient temperature range as stated in section 10.1. Environmental.

For IP20 units, installation is required in a pollution degree 1 environment.

For IP66 (NEMA 4X) units, installation in a pollution degree 2 environment is permissible.

Electrical Installation Requirements

Incoming power supply connection must be according to section 4.3. Incoming Power Connection.

Suitable Power and motor cables should be selected according to the data shown in section 10.2. Rating Tables and the National Electrical Code or other applicable local codes.

Motor Cable 75°C Copper must be used.

Power cable connections and tightening torques are shown in sections 3.3. Mechanical Dimensions and Mounting – IP20 Open Units and 3.5. Mechanical Dimensions – IP66 (NEMA 4X) Enclosed Units.

Integral Solid Sate short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the national electrical code and any additional local codes. Ratings are shown in section 10.2. Rating Tables

Transient surge suppression must be installed on the line side of this equipment and shall be rated 480Volt (phase to ground), 480 Volt (phase to phase), suitable for over voltage category iii and shall provide protection for a rated impulse withstand voltage peak of 4kV.

UL Listed ring terminals / lugs must be used for all bus bar and grounding connections.

General Requirements

escodrives EDS3 provides motor overload protection in accordance with the National Electrical Code (US).

- Where a motor thermistor is not fitted, or not utilised. Thermal Overload Memory Retention must be enabled by setting P-60 = 1.
- Where a motor thermistor is fitted and connected to the drive, connection must be carried out according to the information shown in section 4.9.2. Motor Thermistor Connection.

10.4. EMC Filter Disconnect

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected by completely removing the EMC screw on the side of the product.

Remove the screw as indicated below.

The escodrives product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply. No flash test should be performed on the drive.

IP66

11. Troubleshooting

11.1. Fault Code Messages

Fault Code	No.	Description	Suggested Remedy
no-FLE	00	No Fault	Not required.
01-6	01	Brake channel over current	Check external brake resistor condition and connection wiring.
OL-br	02	Brake resistor overload	The drive has tripped to prevent damage to the brake resistor.
0-1	03	Output Over Current	Instantaneous Over current on the drive output. Excess load or shock load on the motor. NOTE Following a trip, the drive cannot be immediately reset. A delay time is inbuilt,
1_E-E-P	04	Motor Thermal Overload (12t)	which allows the power components of the drive time to recover to avoid damage. The drive has tripped after delivering > 100% of value in P-08 for a period of time to prevent damage to the motor.
PS-E-P	05	Power stage trip	Check for short circuits on the motor and connection cable
O-uort	06	Over voltage on DC bus	Check the supply voltage is within the allowed tolerance for the drive. If the fault occurs on deceleration or stopping, increase the deceleration time in P-O4 or install a suitable brake resistor and activate the dynamic braking function with P-34.
U-uort	07	Under voltage on DC bus	The incoming supply voltage is too low. This trip occurs routinely when power is removed from the drive. If it occurs during running, check the incoming power supply voltage and all components in the power feed line to the drive.
0-E	08	Heatsink over temperature	The drive is too hot. Check the ambient temperature around the drive is within the drive specification. Ensure sufficient cooling air is free to circulate around the drive.
U-F	09	Under temperature	Trip occurs when ambient temperature is less than -10°C. Temperature must be raised over -10°C in order to start the drive.
P-dEF	10	Factory Default parameters loaded	
E-Er iP	11	External trip	E-trip requested on digital input 3. Normally closed contact has opened for some reason. If motor thermistor is connected check if the motor is too hot.
50-065	12	Bus comms loss	Check communication link between drive and external devices. Make sure each drive in the network has its unique address.
FLE-dc	13	DC bus ripple too high	Check incoming supply phases are all present and balanced.
P-L055	14	Input phase loss trip	Check incoming power supply phases are present and balanced.
h 0-1	15	Output Over Current	Check for short circuits on the motor and connection cable. NOTE Following a trip, the drive cannot be immediately reset. A delay time is inbuilt, which allows the power components of the drive time to recover to avoid damage.
Eh-FLE	16	Faulty thermistor on heatsink	.3
dALA-F	17	Internal memory fault (IO)	Press the stop key. If the fault persists, consult you supplier.
4-20 F	18	4-20mA Signal Lost	Check the analog input connection(s).
dALA-E	19	Internal memory fault (DSP)	Press the stop key. If the fault persists, consult you supplier.
F-PLc	21	Motor PTC thermistor trip	Connected motor thermistor over temperature, check wiring connections and motor.
FRn-F	22	Cooling Fan Fault (IP66 only)	Check / replace the cooling fan.
O-hEAL	23	Drive internal temperature too high	Drive ambient temperature too high, check adequate cooling air is provided.
5C-F0 I	50	Modbus comms loss fault	Check the incoming Modbus RTU connection cable. Check that at least one register is being polled cyclically within the timeout limit set in P-36 Index 3.
5C-F02	51	CAN comms loss trip	Check the incoming CAN connection cable.
			Check that cyclic communications take place within the timeout limit set in P-36 Index 3.
