

Operation Manual

Ethernet Communication Card

No.	Change description	Version	Release date
1	First release	V1.0	Octomber 2020
2			

Safety precautions

The extension card can be installed and operated only by people who have taken part in professional training on electrical operation and safety knowledge, obtained the certification, and been familiar with all steps and requirements for installing, performing commissioning on, operating, and maintaining the device, and are capable of preventing all kinds of emergencies.

Before installing, removing, or operating the communication card, read the safety precautions described in this manual and the variable-frequency drive (VFD) operation manual carefully to ensure safe operation.

For any physical injuries or damage to the device caused due to your neglect of the safety precautions described in this manual and the VFD operation manual, our company shall not be held liable

- You need to open the housing of the VFD when installing or removing the communication card. Therefore, you must disconnect all power supplies of the VFD and ensure that the voltage inside the VFD is safe. For details, see the description in the VFD operation manual. Severe physical injuries or even death may be caused if you do not follow the instructions.
- Store the communication card in a place that is dustproof and dampproof without electric shocks or mechanical pressure.
- The communication card is electrostatic sensitive. Take measurements to prevent electrostatic discharge when performing operations involving it.
- Tighten the screws up when installing the communication card. Ensure that it is firmly fixed and properly grounded.

Terminology, abbreviations, and acronyms

CAN	Controller Area Network							
СОВ	Communication object, a transmitted unit on a CAN network. Communication objects (COBs) carry data and can be transmitted through the whole network. A COB is part of a CAN message frame.							
EDS	Electronic data sheet (EDS), an ASCII file for node configuration, required when a CANopen network is configured. An EDS file contains general information about nodes and their dictionary objects (parameters).							
NMT	Network management, one of the CAN application-layer service elements in the CAN reference model. It is used for the initialization, configuration, and fault handling of a CAN network.							
Object dictionary	Stores information about all COBs identified by a device.							
PDO	Process data object, a type of COBs, used to transmit process data, such as control command, set values, status values, and actual values.							
PDOn Tx	PDO command transmitted by a slave station to the master station, where n refers to 1, 2, 3, 4.							
PDOn Rx	PDO command transmitted by the master station and received by a slave station, where n refers to 1, 2, 3, 4.							
SDO	Service data object, a type of COB, used to transmit non-time key data, such as parameter values.							
RO	Indicates read-only access.							
RW	Indicates the read and write access.							
SYNC	Indicates synchronous transmission.							
Node-ID	Node ID, that is, address of a communication card.							
0x	Indicates that a number with this prefix is a hexadecimal value, for example, 0x10 indicates the decimal value 16.

1 Product confirmation

Check the following after receiving a communication extension card product:

- Whether the communication card is damaged.
- Whether the received communication card is the one you purchase according to the bar code label on the PCB.
- Whether all the following items are contained in the product package:
- One communication card, one tie wrap, one tie, one M3 screw, and one manual
- If the communication card is damaged, a wrong model is delivered, or some items are missing, contact the supplier in a timely manner.
- Obtain the ESD file of the communication card from INVT. The file is named communication card model.eds.
- Confirm the environmental requirements for application.

Table 1-1 Environmental requirements

Item	Requirement
Operation temperature	-10-+50°C
Storage temperature	-20-+60°C
Relative humidity	5%–95%
Other weather	No condensation, ice, rain, snow, or hail;
conditions	solar radiation < 700 W/m ²
Air pressure	70-106 kPa
Vibration and impact	5.9m/s² (0.6g) at the sine vibration of 9 Hz to 200 Hz

2 PROFINET communication card

2.1 Overview

- Thanks for choosing INVT PROFINET communication cards. This manual describes the
 function specifications, installation, basic operation and settings, and information about
 the network protocol. To ensure that you install and operate the product properly, read
 this manual and the communication protocol section in the VFD operation manual
 carefully before you use the product.
- This manual only describes how to operate the PROFINET communication card and the related commands but does not provide details about the PROFINET protocol. For more information about the PROFINET protocol, read the related specialized articles or books.
- This communication card is defined as a PROFINET slave station communication card and is used on a VFD that supports PROFINET communication.
- The communication card supports the linear network topology and star-shaped network topology.
- The communication card supports 32 inputs/outputs to read and write process data, read state data, and read and write function parameters of a VFD.

2.2 Features

1. Supported functions

- Supports the PROFINET protocol, and supports PROFINET I/O devices
- Provides two PROFINET I/O ports and supports the 100 M full-duplex operation
- > Supports the linear network topology and star-shaped network topology.

2. Supported communication types

Standard Ethernet channels:

Standard Ethernet channels are non-realtime communication channels that use the TCP/IP protocol, and are mainly used for device parameterization and configuration and to read diagnosis data.

Real-time (RT) communication channels:

RT channels are optimized channels for real-time communication. They take precedence over TCP (UDP)/IP, which ensures that various stations on a network perform data transmission with high time requirements at a certain interval. The bus period may reach the precision of millisecond. These channels are used to transmit data such as process data and alarm data.

Isochronous real-time (IRT) communication channels

IRT channels are implemented through the built-in Switch-ASIC IRT chip. IRT communication can further shorten the processing time of the communication stack software, synchronizing data transmission of the program and device. The transmission delay is less than 1 ms, and the jitter is less than 1 µs. The typical application is motion control.

3. Communication ports

Standard RJ45 ports are used in PROFINET communication. The communication card provides two RJ45 ports with no transmission direction defined, and therefore you can insert a cable into the port without regard to its direction. Figure 2-1 shows the ports, and Table 2-1 describes the functions of the ports.

Figure 2-1 Two standard RJ45 ports

Table 2-1 Standard RJ45 port pins

Pin	Name	Description
1	TX+	Transmit Data+
2	TX-	Transmit Data-
3	RX+	Receive Data+
4	n/c	Not connected
5	n/c	Not connected
6	RX-	Receive Data-
7	n/c	Not connected
8	n/c	Not connected

4. State indicators

PROFINET communication card provides nine LED indicators to indicate its states. Table 2-2 describes the state indicators.

Table 2-2 State indicators

LED	Color	State	Description		
LED1	Green		3.3 V power indicator		
LED2 (Bus state indicator)		On	Not connected through a network cable		
	Red	Blinking	Connected to the PROFINET controller		
			through a network cable, but no		

LED	Color	State	Description				
			communication established				
		Off	Communication established with the PROFINET controller				
LED3		On	PROFINET diagnosis enabled				
(System fault indicator)	Red	Off	PROFINET diagnosis disabled				
LED4		On	TPS-1 communication stack started				
(Slave ready indicator)	Green	Blinking	TPS-1 waits for the initialization of MCU				
(Slave ready indicator)		Off	TPS-1 communication stack not started				
LED5 (Maintenance state indicator)	Green		Defined by the manufacturer, depending on the characteristics of the device				
LED6/7 (Network port state	Green	On	PROFINET communication card connected to the PC/PLC through a network cable				
indicator)		Off	PROFINET communication card not connected to the PC/PLC				
LED8/9 (Network port	Croon	On	PROFINET communication card communicating with the PC/PLC				
communication indicator)	Green	Off	PROFINET communication card not communicating with the PC/PLC				

2.3 Electrical wiring

PROFINET communication card provides standard RJ45 ports and supports the linear and star topologies. Figure 2-2 and Figure 2-3 show the electrical wiring diagrams for different topologies.

Use CAT5, CAT5e, and CAT6 network cables for electrical wiring. When the communication distance is greater than 50 meters, use high-quality network cables that meet the national standards.

Figure 2-2 Electrical wiring diagram for a linear topology

Note: For the star-shaped network topology, you need to use a PROFINET switch.

Figure 2-3 Electrical wiring diagram for a star topology

2.4 Communication

2.4.1 Packet format

Table 2-3 describes the structure of an RT frame (non-synchronous).

Table 2-3 Structure of an RT frame

Data header	Etherne type	VLAN	Ethern type	et Frame identifier	RT user data	Period counter		Transmission state	FCS
	2 bytes	2 bytes	2 bytes	s 2 bytes	36–1440 bytes	2 bytes	1 byte	1 byte	4 bytes
	0x8100	1	0x889	2					
	VLA	l flag					APDL	J state	
				Data	header				
7-byte preamble 1-byte synchronization information			byte source	MAC addi	ress	6-byte	destination MA address	C	

Table 2-4 describes the structure of the IRT frame (synchronous).

Table 2-4 Structure of an IRT frame

Data header				Etherne t type	VLA N	Etherne t type	Frame identifie r	IRT user data	FCS
7-byte preambl e	1-byte synchronizatio n	6-byte source MAC addres s	6-byte destinatio n MAC address	2 bytes	2 bytes	2 bytes	2 bytes	36–144 0 bytes	4 byte s

2.4.2 PROFINET I/O communication

The PROFINET communication card supports 16-word input/output. Figure 2-4 shows the packet format for transmitting data with a VFD.

Figure 2-4 Packet structure

By using the 32 inputs/outputs, you can set the reference parameters of the VFD, monitor the status values, transmit control commands, monitor the running state, and read/write the function parameters of the VFD. For specific operations, see the following description.

Parameter zone:

PKW1—Parameter identification

PKW2—Array index number

PKW3—Parameter value 1

PKW4—Parameter value 2

Process data:

CW—Control word (transmitted from the master to a slave. For description, see

Table 2-5)

SW—Status word (transmitted from a slave to the master. For description, see Table 2-7.)

PZD—Process data (defined by users)

(When the process data is output by the master to a slave, it is a reference value; and when the process data is input by a slave to the master, it is an actual value.)

PZD zone (process data zone): The PZD zone in a communication packet is designed for controlling and monitoring a VFD. The master and slave stations always process the received PZD with the highest priority. The processing of PZD takes priority over that of PKW, and the master and slave stations always transmit the latest valid data on the interfaces.

CWs and SWs

Using CWs is the basic method of the fieldbus system to control VFDs. A CW is transmitted by

the fieldbus master station to a VFD device. In this case, the adapter module functions as a gateway. The VFD device responds to the bit code information of the CW and feeds state information back to the master through an SW.

Reference value: A VFD device may receive control information in multiple channels, including analog and digital input terminals, VFD control panel, and communication modules (such as RS485 and CH-PA01 adapter modules). To enable the control over VFD devices through PROFINET, you need to set the communication module as the controller of the VFD device.

Actual value: An actual value is a 16-bit word that includes information about VFD device operation. The monitoring function is defined through VFD parameters. The conversion scale of an integer transmitted as an actual value from the VFD device to the master depends on the set function. For more description, see the related VFD operation manual.

Note: A VFD device always checks the bytes of a CW and reference value.

Task packet (master station -> VFD)

12

to zero

CW: The first word in a PZD task packet is a VFD CW. You can select the expression method according to P15.43. Table 2.5 and Table 2.6 describe the control words (CWs) of the Goodrive 350 series VFD. Table 2.5 and Table 2.6 describe the control words (CWs) of the Goodrive 350 series VFD.

Bit Name Value Description Forward running 2 Reverse running 3 Forward jogging 4 Reverse jogging Communication-based 0-7 5 Stop control command 6 Coast to stop (emergency stop) 7 Fault reset 8 Jogging to stop 9 Decelerate to stop 1 8 Enable writing Enable reading and writing (PKW1-PKW4) იი Motor 1 9-10 Motor group setting 01 Motor 2 1 Enable torque/speed control switching 11 Control mode switching 0 Disable switching Reset power consumption 1 Enable

11 - 15	/	Reserved	

Reference value (REF): The second to twelfth words in a PZD task packet are the main settings. The main frequency settings are provided by the main setting signal source. Table 2-7 describes the settings of Goodrive350 series VFD.

Table 2-7 Settings of Goodrive350 series VFD

Function code	Word	Value range	Default value				
P16.32	Received	0: Invalid	0				
F 10.32	PZD2 1: Set frequency (0–Fmax, unit: 0.01 Hz)						
P16.33	Received	2: PID reference (0-1000, in which 1000 corresponds to	0				
P10.33	PZD3	100.0%)	U				
P16.34	Received	3: PID feedback (0-1000, in which 1000 corresponds to	0				
P 10.34	PZD4	100.0%)	O				

Function code	Word	Value range	Default value
P16.35	Received PZD5	4: Torque setting (-3000—+3000, in which 1000 corresponds to 100.0% of the rated current of the motor)	0
P16.36	Received PZD6	5: Setting of the upper limit of forward running frequency (0–Fmax, unit: 0.01 Hz)	0
P16.37	Received PZD7	6: Setting of the upper limit of reverse running frequency (0–Fmax, unit: 0.01 Hz)	0
P16.38	Received PZD8	7: Upper limit of the electromotive torque (0-3000, in which 1000 corresponds to 100.0% of the rated current of	0
P16.39	Received PZD9	the motor) 8: Upper limit of the brake torque (0-3000, in which 1000	0
P16.40	Received PZD10	corresponds to 100.0% of the rated current of the motor) 9: Virtual input terminal command, 0x000–0x3FF	0
P16.41	Received PZD11	(corresponding to S8, S7, S6, S5, HDIB, HDIA, S4, S3, S2, and S1 in sequence)	0
P16.42	Received PZD12	10: Virtual output terminal command, 0x00-0x0F (corresponding to RO2, RO1, HDO, and Y1 in sequence) 11: Voltage setting (for V/F separation) (0-1000, in which 1000 corresponds to 100.0% of the rated voltage of the motor) 12: AO output setting 1 (-1000-+1000, in which 1000 corresponds to 100.0%) 13: AO output setting 2 (-1000-+1000, in which 1000 corresponds to 100.0%) 14: MSB of position reference (signed number) 15: LSB of position reference (unsigned number) 16: MSB of position feedback (signed number) 17: LSB of position feedback (unsigned number) 18: Position feedback setting flag (position feedback can be set only after this flag is set to 1 and then to 0)	0

Response packet (VFD -> master station)

SW: The first word in a PZD response packet is a VFD SW. You can select the expression method according to P15.43.

Table 2.8 and Table 2.9 describe the control words (CWs) of the Goodrive 350 series VFD.

Table 2-8 Goodrive350 series VFD SWs expressed in decimal format

Bit	Name	Value	Description
		1	Forward running
		2	Reverse running
0–7	Running state	3	Stopped
		4	Faulty
		5	POFF
8	Due welte ee eetebliebe d	1	Ready to run

13 - 14	Dun/Stan mada	1	Terminal-based control
13 - 14	Run/Stop mode	2	Communication-based control
		3	Reserved
15	Heartbeat feedback	1	Heartbeat feedback
15	пеаниеантеефраск	0	No heartbeat feedback

Table 2-9 Goodrive350 series VFD SWs expressed in binary format

Bit	Name	Name Description							
0	Forward running	0: Disable 1: Enable	1						
1	Reverse running	0: Disable 1: Enable	2						
2	Stopped	0: Disable 1: Enable	3						
3	Fault	0: Disable 1: Enable	4						
4	POFF	0: Disable 1: Enable	5						
5	Pre-excited	0: Disable 1: Enable	6						
6 - 15	1	Reserved							

Actual value (ACT): The second to twelfth words in a PZD task packet are the main actual values. The main actual frequency values are provided by the main actual value signal source. Table 2.10 lists the actual status values of the Goodrive 350 series VFD.

Table 2-10 Actual status values of Goodrive350 series VFD

Function code	Word	Value range	Default value
P16.43	Transmitted PZD2	0: Invalid	0
P16.44	Transmitted PZD3	1: Running frequency (x100, Hz)	0
P16.45	Transmitted PZD4	2: Set frequency (x100, Hz)	0
P16.46	Transmitted PZD5	I	0
P16.47	Transmitted PZD6		0
P16.48	Transmitted PZD7	5: Output current (×10, A)	0
P16.49	Transmitted PZD8	6: Actual output torque (x10, %)	0
P16.50	Transmitted PZD9	7: Actual output power (×10, %)	0
P16.51	Transmitted PZD10	8: Rotating speed of the running (x1, RPM) 9: Linear speed of the running (x1, m/s)	0
P16.52	Transmitted PZD11	10: Ramp frequency reference 11: Fault code 12: Al1 value (×100, V)	0
P16.53	Transmitted PZD12	13: AI2 value (x100, V) 14: AI3 value (x100, V) 15: HDIA frequency (x100, kHz) 16: Terminal input state 17: Terminal output state 18: PID reference (x100, %) 19: PID feedback (x100, %) 20: Rated torque of the motor 21: MSB of position reference (signed number) 22: LSB of position reference (unsigned number) 23: MSB of position feedback (signed number) 24: LSB of position feedback (unsigned number) 25: Status word 26: HDIB frequency value (x100, kHz)	0

PKW zone

PKW zone (parameter identification flag PKW1—numerical zone): The PKW zone describes the processing mode of the parameter identification interface. A PKW interface is not a physical interface but a mechanism that defines the transmission mode (such reading and writing a parameter value) of arameter between two communication ends.

Figure 2-5 Parameter identification zone

In the periodic communication, the PKW zone consists of four 16-bit words. The following table describes the definition of each word.

	First word PKW1 (16 bits)									
Bits 15-00	Bits 15–00 Task or response identification flag									
	Second word PKW2 (16 bits)									
Bits 15-00	Bits 15–00 Basic parameter address									
	Third word PKW3 (16 bits)									
Bits 15-00	Value (most significant word) of a parameter or	00								
	error code of the returned value	• • •								
	Fourth word PKW4 (16 bits)									
Bits 15-00	Value (least significant word) of a parameter	0-65535								

Note: If the master station requests the value of a parameter, the values in PKW3 and PKW4 of the packet that the master station transmits to the VFD are no longer valid.

Task request and response: When transmitting data to a slave, the master uses a request number, and the slave uses a response number to accept or reject the request.

Request No. (from the master to a slave) Response signal Request Function Acceptance Rejection No. No task O 0 1 Requesting the value of a parameter 1. 2 3 Modifying a parameter value (one word) [modifying 2 1 3 or 4 the value only on RAM] Modifying a parameter value (two words) [modifying 3 2 3 or 4 the value only on RAM1 Modifying a parameter value (one word) [modifying 4 1 3 or 4 the value on both RAM and EEPROM] Modifying a parameter value (two words) [modifying 5 2 3 or 4 the value on both RAM and EEPROMI

Table 2-11 Task identification flag PKW1

Note: The requests #2, #3, and #5 are not supported currently.

Table 2-12 Response identification flag PKW1

	Response No. (from a slave to the master)
Response No.	Function
0	No response
1	Transmitting the value of a parameter (one word)
2	Transmitting the value of a parameter (two words)
3	The task cannot be executed and one of the following error number is returned: 1: Invalid command 2: Invalid data address 3: Invalid data value 4: Operation failure 5: Password error 6: Data frame error 7: Parameter read only 8: Parameter cannot be modified during VFD running 9: Password protection

PKW examples

Example 1: Reading the value of a parameter

You can set PKW1 to 1 and PKW2 to 0A to read a frequency set through keypad (the address of the frequency set through keypad is 10), and the value is returned in PKW4. The following data is in hexadecimal format.

Request (master station -> VFD)

Response (VFD -> master station)

	PKW1		PKW1 PKW		PKW2 PKW3		PKW4		CW		PZD2		PZD3			PZD12	
Response	00	01	00	0A	00	00	13	88	xx	xx	xx	xx	xx	xx		xx	xx
,		<i>ر</i>			— (0001:	Resp	onse		1388: imete					ddres	s 10	

Example 2: Modifying the value of a parameter (on both RAM and EEPROM)

You can set PKW1 to 4 and PKW2 to 0A to modify a frequency set through keypad (the address of the frequency set through keypad is 10), and the value to be modified (50.00) is in PKW4

Request (master station -> VFD)

Response (VFD-> master station)

PZD examples: The transmission of the PZD zone is implemented through VFD function code settings. For the function codes, see the related INVT VFD operation manual.

Example 1: Reading the process data of a VFD

In this example, PZD3 is set to "8: Rotating speed of the running" through the VFD parameter P15.14. This operation sets the parameter forcibly. The setting remains until the parameter is set to another option.

Response (VFD -> master station)

	PKW1 PKW2		W2	PK	W3	PK۱	N4	C۱	N	PZI	D2	PZ	:D3	 PZI	D12	
Res	p _{xx}	xx	xx	xx	xx	vv	xx	xx	xx	xx	xx	xx	00	0A	xx	XX
ons		**	**	**	**	**	**	**	**	**	**	**	00	UA	 XX	**

Example 2: Writing process data to a VFD device

In this example, PZD3 is set to "2: PID reference" through the VFD parameter P15.03. The parameter specified in each request frame is updated with the information contained in PZD3 until another parameter is specified.

Request (master station -> VFD)

	PKW1		PK	W2	PK	W3	PK۱	N4	CV	٧	PZI	D2	PZ	.D3	 PZI	012
Resp onse	XX	xx	xx	xx	xx	xx	xx	xx	xx	xx	xx	xx	00	00	 xx	xx

Subsequently, the information contained in PZD3 is used as tractive force reference in each request frame until another parameter is specified.

2.5 Example of PLC communication

This example shows how to use a Siemens S7-1200 series PLC to communicate with the PROFINET adapter module (through using the TIA Portal V13 PC software as the configuration tool).

2.5.1 Parameter configuration

Connect the PLC to the PC with a standard network cable, and set the computer IP (e.g. 192.168.0.100) in the PC network settings. Set the IP and name of the PLC.

1) Open the "TIA PORTAL V13" software, and click "Online & Diagnostics" --> "Accessible Devices" on the left. Select "PN/IE" in the drop-down list of "Type of the PG/PC interface", select the Ethernet port in the "PG/PC Interface", and finally click "Refresh" to scan the connected PLC devices, as shown in the following figure.

2) If the connection between the PLC and PC is normal, after scanning is completed, the PLC device will appear in the device bar, as shown in the red box of the following figure. The device bar displays the device, device type and device MAC address. Then click the "Show" button in the lower right corner to enter the device settings.

3) Click "Online & Diagnostics" in the device tree, click "Assign IP Address" under the "Functions" on the right of the menu bar, and set the IP address and subnet mask of the PLC shown in the red box marked ③, to ensure that the IP address of the PC and the IP address of the PLC are in the same network segment, as shown in the following figure.

4) Set the IP address of the PLC to "192.168.0.1" and subnet mask to "255.255.255.0" (you can check "Use router", that is, the router assigns IP). Click the "Assign IP address" button after the setting is completed, as shown in the following figure.

5) Click "Assign Name", and mark the PLC name in the position shown in the red box marked ②, such as "PLC1215C". Click the "Assign Device Name" button, as shown in the following figure.

2.5.2 Create a new project

Double click the TIA PORTAL V13 icon to open the TIA PORTAL V13 project tool. Click the "Create new project" button to create a new project, add project name, project storage path, author, comment and other related information, and click the "Create" button to create a new project, as shown in the following figure.

After creating a new project, double click "Open the project view", as shown in the following figure.

2.5.3 Add GSD files

In the project view, click "Options" on the toolbar, select the "Manage general station description files (GSD)" option from the drop-down list, and a box pops up, as shown in the following figure. Enter the file directory where the INVT GSD file is located in the source path, select the GSD file, and click the "Install" button to start the installation.

After the installation was completedly successfully, a prompt pops up, indicating that the GSDML file has been installed successfully, as shown in the following figure.

2.5.4 Configure the basic information of the project

1) Enter the "Devices & networks" view interface

In the project view, select and double click "Devices & networks" in the project tree on the left to enter the "Network overview" view interface, as shown in the following figure.

- 2) Add Project device and PROFINET network
- 1) Add PLC S7-1215C to the "Devices & networks" view

In the "Hardware catalog" on the right sidebar, select "Controller" \rightarrow "SIMATIC S7-1200" \rightarrow "CPU" \rightarrow "CPU 1215C AC/DC/Rly" \rightarrow "6ES7 215-1BG40-0XB0", and double click the "6ES7 215-1BG40-0XB0" icon or drag it to the project, as shown in the following figure.

(2) Add the INVT communication card to the "Devices & networks" view

In the "Hardware Catalog", click "Other field devices" → "Profinet IO" → "I/O" → "INVT" → "INVT Profinet Adapter" → "INVT Profinet Adapter V1.0", and double click the "INVT Profinet Adapter V1.0" icon or drag it to the view of "Devices & networks". The communication card is displayed as "Not assigned", as shown in the following figure.

Click the "Not assigned" option of " INVT Profinet Adapter V1.0" and select the IO controller " PLC_1. PROFINET IO-System", then CPU and INVT Profinet in the network view are connected to the same Profinet subnet, as shown in the following figure.

3) Add the INVT I/O sub-module to the project

Double click the "INVT Profinet Adapter V1.0" icon in the "Devices & Networks" view to enter the "Device view" interface, as shown in the following figure.

Click the "Hardware Catalog" on the right → "Module", double click the "32 Byte IN/OUT" module or drag it to the blank space in the "Device view", and the "32 Byte IN/OUT" module is added to the project, as shown in the following figure.

- (4) Simple configuration of S7-1215C and INVT Profinet parameters
- <1>Configure parameters of PLC S7-1215C

Double click the "Devices & Networks" option to enter the view interface of "Devices & Networks".

Double click the "PLC S7-1215C" icon in the interface to enter the "Device view" interface of the PLC.

Double click the network interface position in the PLC icon to enter the properties editing interface bar of "PROFINET interface 1".

Click the "Ethernet addresses" option in the "General" list to set the PLC address and name (In this example, IP address of the PLC is 192.168.0.1 and PLC name is PLC1215C).

Operations are shown in the following figure.

<2> Configure parameters of the INVT Profinet communication card

Double click the "Devices & Networks" option to enter the view interface of "Devices & Networks".

Double click the "INVT Profinet Adapter V1.0" icon in the interface to enter the "Device view" interface of the communication card.

Double click the network interface position in the INVT Profinet communication card icon to enter the properties editing interface bar of PROFINET interface.

Click the "PROFINET interface [X1]" option in the "General" list, and click the "Ethernet addresses" option. Configure parameters of the INVT PROFINET communication card according to the parameters shown in the following figure such as IP address and device name of the communication card (in this example, IP address of the communication card is 192.168.0.2 and the name is invt1).

Operations are shown in the following figure.

2.5.5 Assign the device name of the IO device (INVT communication card)

After the CPU and INVT Profinet communication card are successfully connected to the PC through the network cable, click "Online access" on the left to find the network card corresponding to the PC that is connected to the PLC and communication card.

In all displayed devices, find the INVT communication card device and click it, such as emc (192.168.0.2) device, as shown in the following figure (**Note**: When the communication card is used for the first time, there is no device name, and only the default IP can be scanned).

Double click "Online & Diagnostics" to enter the online diagnostics state.

Click "Functions" → "Assign name" to enter the "Assign name" interface.

Enter the communication card name in "PROFINET device name", and click "Assign Name" in the lower right corner to confirm.

Note: The name of the PROFINET communication card set online must be consistent with that set in the configuration project, otherwise PROFINET communication cannot be carried out between the devices.

The operation steps are shown in the following figure.

2.5.6 Save, compile, and download

Download the project configuration information to the PLC S7-1215C after the entire project configuration is completed.

Click "Save Project" to save the entire project.

Right click "PLC_1 [CPU 1215C AC/DC/Rly]" → left click "Compile" → "Hardware and software (change only)" to compile the entire project.

Click the "Download to device" icon to download the project configuration to the PLC controller.

Operations are shown in the following figure.

In the download dialog box, search for the connected PLC device, as shown in the following figure.

Select the "PN/ IE_1" option in the drop-down list of "Connection to interface/subnet".

Click the "Start search" button in the lower right corner to start scanning and detecting PLC devices in the subnet.

After searching is completed, the PLC S7-1215C that is connected to the PC will be displayed in the list of "Compatible devices in target subnet", as shown in the following figure.

Select the PLC to be downloaded in the following figure, and click the "Download" button to download the configuration information and PLC program to the selected PLC.

2.5.7 VFD parameter watching

Click "Watch and force tables" in the left menu bar, and double click "Add new watch table" in the drop-down menu, as shown in the following figure.

Create target watch variables—PZD, PKW, control word and status word variables of the VFD in the newly created watch table, as shown in the following figure.

After the watch variables are created, click the "Watch all" button in the watch table to monitor the values of all variables, and click the "Modify parameters" button in the watch table to modify the parameters of the target variable, so as to watch the VFD through the PLC.

3 Ethernet IP communication card

3.1 Overview

- Thanks for choosing INVT Ethernet IP communication cards. This manual describes the
 function specifications, installation, basic operation and settings, and information about
 the network protocol. To ensure that you install and operate the product properly, read
 this manual and the communication protocol section in the VFD operation manual
 carefully before you use the product.
- This manual only describes how to operate the Ethernet IP communication card and the related commands but does not provide details about the EtherNet/IP protocol. For more information about the Ethernet IP protocol, read the related specialized articles or books.
- This communication card is defined as an Ethernet IP slave station communication card and is used on a VFD that supports EtherNet/IP communication.
- 4. The communication card supports the star, linear, and ring topologies.
- The communication card supports 32 inputs/outputs to read and write process data, read state data, and read and write function parameters of a VFD.

3.2 Features

1. Supported functions

- > Supports the EtherNet/IP protocol, and supports EtherNet/IP devices.
- Provides two EtherNet/IP ports and supports the 10/100M full-duplex/half-duplex operation.
- Supports the star, linear, and ring topologies (but does not support ring-network monitoring).

2. Supported communication types

EtherNet/IP adopts the application layer protocol CIP, which is also used by DeviceNet and ControlNet. Therefore, they use the same object library and consistent industrial specifications.

CIP uses non-connected UDP/IP and connection-based TCP/IP for information control and transmission over the Ethernet, allowing the sending of explicit and implicit packets. Implicit packets are time-critical control messages and transmitted using UDP/IP. Explicit packets are point-to-point messages that are not time critical and transmitted using TCP/IP. Explicit packets are used for configuration, download, and fault diagnosis, while implicit packets are used for real-time I/O data transmission.

3. Communication ports

Standard RJ45 ports are used in EtherNet/IP communication. The communication card provides two RJ45 ports with no transmission direction defined, and therefore you can insert a cable into the port without regard to its direction. Figure 3-1 shows the ports, and Table 3-1 describes the port pins.

Figure 3-1 Two standard RJ45 ports

Table 3-1 Standard RJ45 port pins

Pin	Name	Description
1	TX+	Transmit Data+
2	TX-	Transmit Data-
3	RX+	Receive Data+
4	n/c	Not connected
5	n/c	Not connected
6	RX-	Receive Data-
7	n/c	Not connected
8	n/c	Not connected

4. State indicators

The EtherNet/IP communication card provides four LED indicators and four net port indicators to indicate its states. Table 3-2 describes the state indicators

Table 3-2 State indicators

LED	Color	State	Description
		On	Indicating that the card and VFD identify each
		Oil	other.
LED1	Croon	Green Blinking (1Hz) Off	Indicating that the card and VFD communicate
LEDI	Green		normally.
			Indicating that the card and VFD communicate
			improperly.
			Indicating that communication between the card
LED2	Green	Green On	and PLC is online and data interchange is
			allowed.

LED	Color	State	Description		
		Blinking (1Hz) Indicating IP address conflict between the cand PLC.			
		Off	Indicating that communication between the card and PLC is offline.		
		On	Failed to set up I/O between the card and PLC.		
		Blinking (1Hz)	Incorrect PLC configuration.		
LED3	Red	Blinking (2Hz)	The card failed to send data to the PLC.		
LEDS	Red	Blinking (4Hz)	The connection between the card and PLC timed out.		
		Off	No fault		
LED4	Red	On	3.3V power indicator		
Net port	Yellow	On	Link indicator, indicating successful Ethernet connection.		
indicator	reliow	Off	Link indicator, indicating that Ethernet connection is not established.		
Net port	Green	On	ACK indicator, indicating that data interchange being performed.		
indicator	Green	Off	ACK indicator, indicating that data interchange is not be performed.		

3.3 Electrical wiring

The Ethernet IP communication card provides standard RJ45 ports and supports the linear, star, and ring topologies. Figure 3-2, Figure 3-3, and Figure 3-4 show the electrical wiring diagrams for different topologies.

Use CAT5, CAT5e, and CAT6 network cables for electrical wiring. When the communication distance is greater than 50 meters, use high-quality network cables that meet the national standards.

Figure 3-2 Electrical wiring diagram for a linear topology

Figure 3-3 Electrical wiring diagram for a star topology

Note: An Ethernet switch must be available when the star topology is used.

Figure 3-4 Electrical wiring diagram for a ring network

3.4 Communication

3.4.1 Communication settings

The EtherNet/IP communication card can function as only the EtherNet/IP slave station. Before communication, set Goodrive350 function codes, including:

IP address and subnet mask for the card.

The default IP address and subnet mask for each communication card are 192.168.0.1 and 255.255.255.0. You can change them to the address of a network segment.

Control mode

If you want to control the VFD with the communication card, set the control mode to EtherNet/IP communication control. To be specific, set P00.01=2 (communication as the running command channel) and set P00.02=3 (EtherNet/IP communication channel) to control VFD start and stop. If you want to set a value through EtherNet/IP communication, change the control way of corresponding function codes to EtherNet/IP communication. Appendix B lists related function codes.

Note: After the setting, the card can communicate normally. If you want to control the VFD with the card, set related function codes to enable EtherNet/IP communication control.

3.4.2 Packet format

Table 3-3 describes the structure of a TCP communication packet.

Table 3-3 Structure of a TCP communication packet

MAC-layer packet header	IP-layer packet header	TCP-layer packet header	Valid data	Packet trailer
14 bytes	20 bytes	20 bytes	0–1488 bytes	4 bytes

Table 3-4 describes the structure of a UDP communication packet.

Table 3-4 Structure of a UDP communication packet

MAC-layer packet header	IP-layer packet header	UDP-layer packet header	Valid data	Packet trailer
14 bytes	20 bytes	20 bytes	0-1488 bytes	4 bytes

3.4.3 Ethernet IP communication

The EtherNet/IP communication card supports 16-word input/output. Figure 3-5 shows the packet format for transmitting data with a VFD.

Figure 3-5 Packet structure

By using the 32 inputs/outputs, you can set the reference parameters of the VFD, monitor the status values, transmit control commands, monitor the running state, and read/write the function parameters of the VFD. For specific operations, see the following description.

Parameter zone:

PKW1—Parameter identification

PKW2—Array index number

PKW3—Parameter value 1

PKW4---Parameter value 2

Process data:

CW—Control word (transmitted from the master to a slave. For description, see Table 3-5.)

SW—Status word (transmitted from a slave to the master. For description, see Table 3-8.)

PZD—Process data (user defined)

(The process data output from the master to a slave is a reference value, and the process data input from a slave to the master is an actual value.)

PZD zone (process data zone): The PZD zone in a communication packet is designed for controlling and monitoring a VFD. The master and slave stations always process the received PZD with the highest priority. The processing of PZD takes priority over that of PKW, and the master and slave stations always transmit the latest valid data on the interfaces.

CWs and SWs

Using CWs is the basic method of the fieldbus system to control VFDs. A CW is transmitted by the fieldbus master station to a VFD device. In this case, the adapter module functions as a gateway. The VFD device responds to the bit code information of the CW and feeds state information back to the master through an SW.

Reference value: A VFD device may receive control information in multiple channels, including analog and digital input terminals, VFD control panel, and communication modules (such as RS485 and CH-PA01 adapter modules). To enable the control over VFD devices through EtherNet/IP, you need to set the communication module as the controller of the VFD device.

Actual value: An actual value is a 16-bit word that includes information about VFD device operation. The monitoring function is defined through VFD parameters. The conversion scale of an integer transmitted as an actual value from the VFD device to the master depends on the set function. For more description, see the related VFD operation manual.

Note: A VFD device always checks the bytes of a CW and reference value.

Task packet (master station -> VFD)

CW: The first word in a PZD task packet is a VFD CW.

When P15.43=0, EtherNet IP control words are defined by byte. Table 3-5 describes Goodrive350 series VFD CWs defined by byte.

Table 3-5 Goodrive350 series VFD CWs expressed in decimal format

Bit	Name	Value	Description
		1	Forward running
		2	Reverse running
		3	Forward jogging
	Communication-based	4	Reverse jogging
0–7	control command	5	Stop
	control command	6	Coast to stop (emergency stop)
		7	Fault reset
		8	Jogging to stop
		9	Decelerate to stop
8	Enabling writing	1	Enable writing (mainly through PKW1 to
0	Enabling writing		PKW4)
9–10	Motor group setting	00	Motor 1
3-10	wotor group setting	01	Motor 2
11	Control mode switching	1	Enable torque/speed control switching
- 11	Control mode switching	0	Disable switching
12	Resetting power	1	Enable
12	consumption to zero	0	Disable
13	Pre-excitation	1	Enable
13	Fie-excitation	0	Disable
14	DC broking	1	Enable
14	DC braking	0	Disable
15	Heartbeat reference	1	Enable
15	пеаниеан тететепсе	0	Disable

When P16.56=1, EtherNetIP control words are defined by bit. Table 3-6 describes Goodrive350 series VFD CWs defined by bit.

Table 3-6 Goodrive350 series VFD CWs expressed in binary format

Bit	Name	Description	Priority
0	Forward running	0: Decelerate to stop 1: Forward running	1
1	Reverse running	0: Decelerate to stop 1: Reverse running	2
2	Fault reset	0: Disable 1: Enable	3
3	Coast to stop	0: Disable 1: Enable	4
4	Forward jogging	0: Disable 1: Enable	5
5	Reverse jogging	0: Disable 1: Enable	6
6	Jogging to stop	0: Disable 1: Enable	7

Bit	Name	Description	Priority
7	/	Reserved	
8	Enable reading and writing (PKW1-PKW4)	0: Disable 1: Enable	
9	/	Reserved	
10	Decelerate to stop	0: Disable 1: Enable	0: Top priority
11 - 15	1	Reserved	

Reference value (REF): The second to twelfth words in a PZD task packet are the main settings. The main frequency settings are provided by the main setting signal source. Table 3-7 describes the settings of Goodrive350 series VFD.

Table 3-7 Settings of Goodrive350 series VFD

Function code	Word	Value range	Default value
P16.32	Received PZD2	0: Invalid 1: Set frequency (0–Fmax, unit: 0.01 Hz)	0
P16.33	Received PZD3	2: PID reference (0-1000, in which 1000 corresponds to 100.0%)	0
P16.34	Received PZD4	3: PID feedback (0–1000, in which 1000 corresponds to 100.0%)	0
P16.35	Received PZD5	4: Torque setting (-3000+3000, in which 1000 corresponds to 100.0% of the rated current of the motor)	0
P16.36	Received PZD6	5: Setting of the upper limit of forward running frequency (0–Fmax, unit: 0.01 Hz)	0
P16.37	Received PZD7	6: Setting of the upper limit of reverse running frequency (0–Fmax, unit: 0.01 Hz)	0
P16.38	Received PZD8	7: Upper limit of the electromotive torque (0-3000, in which 1000 corresponds to 100.0% of the rated current of	_
P16.39	Received PZD9	the motor) 8: Upper limit of the brake torque (0–3000, in which 1000	0
P16.40	Received PZD10	corresponds to 100.0% of the rated current of the motor) 9: Virtual input terminal command, 0x000–0x3FF	0
P16.41	Received PZD11	(corresponding to S8, S7, S6, S5, HDIB, HDIA, S4, S3, S2, and S1 in sequence) 10: Virtual output terminal command, 0x00-0x0F	0
P16.42	Received PZD12	(corresponding to RO2, RO1, HDO, and Y1 in sequence) 11: Voltage setting (for V/F separation) (0–1000, in which 1000 corresponds to 100.0% of the rated voltage of the motor)	0

Function code	Word	Value range	
		12: AO output setting 1 (-1000—+1000, in which 1000 corresponds to 100.0%) 13: AO output setting 2 (-1000—+1000, in which 1000 corresponds to 100.0%) 14: MSB of position reference (signed number) 15: LSB of position reference (unsigned number) 16: MSB of position feedback (signed number) 17: LSB of position feedback (unsigned number) 18: Position feedback setting flag (position feedback can be set only after this flag is set to 1 and then to 0)	

Response packet (VFD -> master station)

Status word (SW): The first word in a PZD response packet is a VFD SW.

P15.43=0 (SWs are defined in decimal format), and the VFD SWs are defined as follows.

Table 3-8 Goodrive350 series VFD SWs expressed in decimal format

Bit	Name	Value	Description
		1	Forward running
		2	Reverse running
0–7	Running state	3	Stopped
		4	Faulty
		5	POFF
8	Dua voltaga aatabliahad	1	Ready to run
8	Bus voltage established	0	Not ready to run
9–10	Mater many facilities	0	Motor 1
9-10	Motor group feedback	1	Motor 2
11	Matar tupa faadbaak	1	Synchronous motor
''	Motor type feedback	0	Asynchronous motor
12	Overland are clarm foodback	1	Overload pre-alarm generated
12	Overload pre-alarm feedback	0	No overload pre-alarm generated
		0	Keypad-based control
13 - 14	Dun/Stan mada	1	Terminal-based control
13 - 14	Run/Stop mode	2	Communication-based control
		3	Reserved
15	Heartbeat feedback	1	Heartbeat feedback
15	пеаниеантеефраск	0	No heartbeat feedback

P15.43=1 (SWs are defined in binary format), and the VFD SWs are defined as follows.

Table 3-9 Goodrive350 series VFD SWs expressed in binary format

Bit	Name	Description	Priority
0	Forward running	0: Disable 1: Enable	1
1	Reverse running	0: Disable 1: Enable	2
2	Stopped	0: Disable 1: Enable	3
3	Fault	0: Disable 1: Enable	4
4	POFF	0: Disable 1: Enable	5
5	Pre-excited	0: Disable 1: Enable	6
6 - 15	/	Reserved	

Actual value (ACT): The second to twelfth words in a PZD task packet are the main actual values. The main actual frequency values are provided by the main actual value signal source.

Table 3-10 Actual status values of Goodrive350 series VFD

Function code	Word	Value range	Default value
P16.43	Transmitted PZD2	0: Invalid	0
P16.44	Transmitted PZD3	1: Running frequency (x100, Hz)	0
P16.45	Transmitted PZD4	2: Set frequency (x100, Hz)	0
P16.46	Transmitted PZD5	3: Bus voltage (x10, V)	0
P16.47	Transmitted PZD6	4: Output voltage (x1, V)	0
P16.48	Transmitted PZD7	5: Output current (×10, A)	0
P16.49	Transmitted PZD8	6: Actual output torque (x10, %)	0
P16.50	Transmitted PZD9	7: Actual output power (×10, %)	0
P16.51	Transmitted PZD10	8: Rotating speed of the running (x1, RPM) 9: Linear speed of the running (x1, m/s)	0
P16.52	Transmitted PZD11	10: Ramp frequency reference 11: Fault code	0
P16.53	Transmitted PZD12	12: Al1 value (x100, V) 13: Al2 value (x100, V) 14: Al3 value (x100, V) 15: HDIA frequency (x100, kHz) 16: Terminal input state 17: Terminal output state 18: PID reference (x100, %) 19: PID feedback (x100, %) 20: Rated torque of the motor 21: MSB of position reference (signed number)	0

Function code	Word	Value range	Default value
		22: LSB of position reference (unsigned number) 23: MSB of position feedback (signed number) 24: LSB of position feedback (unsigned number) 25: Status word 26: HDIB frequency value (x100, kHz)	

PKW zone

PKW zone (parameter identification flag PKW1—numerical zone): The PKW zone describes the processing mode of the parameter identification interface. A PKW interface is not a physical interface but a mechanism that defines the transmission mode (such reading and writing a parameter value) of arameter between two communication ends.

Figure 3-6 Parameter identification zone

In the periodic communication, the PKW zone consists of four 16-bit words. The following table describes the definition of each word.

First word PKW1 (16 bits)						
Bits 15-00	Bits 15–00 Task or response identification flag 0 - 7					
	Second word PKW2 (16 bits)					
Bits 15-00	Basic parameter address	0 - 247				
Third word PKW3 (16 bits)						
Bits 15–00 Value (most significant word) of a parameter or		00				
error code of the returned value						
Fourth word PKW4 (16 bits)						
Bits 15–00 Value (least significant word) of a parameter 0 - 6553						

Note: If the master station requests the value of a parameter, the values in PKW3 and PKW4 of the packet that the master station transmits to the VFD are no longer valid.

Task request and response: When transmitting data to a slave, the master uses a request number, and the slave uses a response number to accept or reject the request.

Table 3-11 Task identification flag PKW1

	Request No. (from the master to a slave)	Respons	se signal
Request No.	Function	Acceptance	Rejection
0	No task	0	
1	Requesting the value of a parameter	1, 2	3
2	Modifying a parameter value (one word) [modifying the value only on RAM]	1	3 or 4
3	Modifying a parameter value (two words) [modifying the value only on RAM]	2	3 or 4
4	Modifying a parameter value (one word) [modifying the value on both RAM and EEPROM]	1	3 or 4
5	Modifying a parameter value (two words) [modifying the value on both RAM and EEPROM]	2	3 or 4

Note: The requests #2, #3, and #5 are not supported currently.

Table 3-12 Response identification flag PKW1

	Response No. (from a slave to the master)					
Response No.	Function					
0	No response					
1	Transmitting the value of a parameter (one word)					
2	Transmitting the value of a parameter (two words)					
3	The task cannot be executed and one of the following error number is returned: 1: Invalid command 2: Invalid data address 3: Invalid data value 4: Operation failure 5: Password error 6: Data frame error 7: Parameter read only 8: Parameter cannot be modified during VFD running 9: Password protection					

Model specified in the standard ODVA agreement

The standard ODVA protocol specifies the data transmission format and CWs/SWs definitions, and the packet format for data transmission with the VFD is shown in Table 3.13.

Table 3.13 Transmission modes specified in standard ODVA protocol

No.	Input/Output	Data length (bytes)	Format (word)
2	70/20	4	CW1/SW1 + Speed_ref/act
3	71/21	4	CW2/SW2 + Speed_ref/act
4	72/22	6	CW1/SW1 + Speed_ref/act + Torque_ref/act
5	73/23	6	CW2/SW2 + Speed_ref/act + Torque_ref/act

In which, CW1/SW1 and CW2/SW2 are defined as shown in Tables 3.14, 3.15, 3.16 and 3.17.

Table 3.14 CW1 specified in standard ODVA protocol

Bit	Name	Value	Description
0	Farmand amazina	0	Disable
U	Forward running	1	Enable
1	Reserved	/	/
2	2 Fault reset	0	Disable
		1	Enable
3–15	Reserved	/	/

Table 3.15 SW1 specified in standard ODVA protocol

> INVT extended data model based on the ODVA Protocol

Based on the ODVA protocol provisions, these four modes are combined with PZD process data defined by INVT, and the packet format for data transmission with the VFD is shown in Table 3.18

Table 3.18 INVT extended data model based on the ODVA protocol

	No.	Input/Output	Data length (bytes)	Format (word)
I	6	74/24	24	CW1/SW1 + Speed_ref/act + Null +PZD4-12

No.	Input/Output	Data length (bytes)	Format (word)
7	75/25	24	CW2/SW2 + Speed_ref/act + Null +PZD4-12
8	76/26	24	CW1/SW1 + Speed_ref/act + Torque_ref/act + PZD4-12
9	77/27	24	CW2/SW2 + Speed_ref/act + Torque_ref/act + PZD4-12

In these four modes, definitions of CWs and SWs are consistent with that of "Model specified in the standard ODVA agreement", and definitions of PZD4–12 are consistent with that of "INVT self-defined mode".

3.5 Example 1 of PLC communication (communicate with Allen-Bradley PLC)

This example shows how to use an Allen-Bradley PLC (model: 1769_L36ERMS) to communicate with an Ethernet IP adapter module (through using the Studio 5000 software as the configuration tool).

3.5.1 Create a new project

Connect the PC to the PLC with a printer cable or network cable. Open

Select the correct PLC model, fill in the project name, click "Next", and click "Finish".

3.5.2 Import an EDS file

The EDS file is used to specify device attributes for Ethernet IP client. The client identifies the device through product code, device type, and major version attributes.

You can obtain the EDS file of the communication card from the vendor, or downloaded it (file name: GD350 EthernetIP V1.01.eds) from the INVT website at www.invt.com.cn.

Right click "TOOLS", and select "EDS Hardware Installation Tool".

Click "Next".

Select the option as shown in the following figure, and click "Next".

Click "Browse" to select the EDS file that you want to download, and then click "Next".

Continue to click "Next".

Click "Next" again, and the installation is successful.

3.5.3 Create a new device object

Select "I/O Configuration"->"Ethernet item" on the left, and right click "New Module".

Select "GD350_EthernetIP_MODULE", and click "Create".

Fill in the module name, and set the IP address of the module. The IP address must be consistent with P16.02-P16.05 on the GD350 Ethernet IP communication card, otherwise communication fails.

Click the "Change" option to select the protocol type used by the module. Each type differs in IO format, so you need to select the corresponding IO format based on the protocol type, as shown in the following table. Take "Exclusive Owner" as an example.

Name	Size	Format
Exclusive Owner	16	INT
20/70 Basic speed control	2	INT
21/71 Extended speed control	2	INT
22/72 Basic Speed and Torque control	3	INT
23/73 Extended Speed and Torque control	3	INT
INVT 24/74 Basic Speed Control plus Drive Parameters	12	INT
INVT 25/75 Enhanced Speed Control plus Drive Parameters	12	INT
INVT 26/76 Basic Speed and torque Control plus Drive Parameters	12	INT
INVT 27/77 Enhanced Speed and torque Control plus Drive Parameters	12	INT

Click "OK", "Yes", "OK", "OK", "OK", and "OK" in turn.

Once the module has been created successfully, you can see it under the "Ethernet" item under "I/O Configuration" on the left, and click it to check the device information.

3.5.4 Use of Rslinx Classic

Rslinx Classic is used to connect the PC to the PLC. Open the "Rslinx Classic" software.

Click the "S" icon, and a window of "Configure Drivers" pops up. Select "Ethernet/IP Driver" in the drop-down menu of "Available Driver Types", click "Add New", a window of "Add New RSLinx Classic Driver" pops up, and click "OK".

In the "Configure driver" window that pops up, select your computer's network card and click "OK".

3.5.5 Writing PLC programs

Click on "Tasks"-->"MainTask"-->"MainProgram"--> on the left. Right click on "MainProgram" and "Parameters and Local Tag" above "MainRoutine" to create global variables. Right click "Parameters and Local Tag" above "MainProgram" to create global variables.

3.5.6 PC connection and program download

Click on "COMMUNICATIONS" under "Who Active", and in the pop-up screen, click on PLC Project under the "USB" option. "Dowmload". **Note**: The PLC dial code cannot be "RUN" at this time.

3.5.7 Configuring PLC IP Addresses through the studio5000 V31 software

Make sure that the PLC is in REM or PROG mode, click "1769-L36ERMS" at the bottom left to enter the "Controller Properties" interface, and then click "Internet Protocol" to change the IP address of the PLC.

3.5.8 DLR Ring Network Configuration

(1) Using Logix Designer for setup

Open the Studio 5000 software and use an Allen-Bradley CompactLogix PLC with ring networking capability, which requires at least two GD350 Ethernet IP communication cards. More GD350 Ethernet IP communication cards can be added, but it is recommended that the maximum number of nodes used on the DLR ring network shall not exceed 32. The connection method is shown in the following figure.

Note: An EDS file must be added.

(2) Add an Ethernet IP communication card to the Studio 5000 software

The method of addition is the same as that of the linear star connection.

(3) Enabling PLC ring network monitor function

Double click "1769-L36ERMS INVTS" under the "I/O Configuration" folder, as shown in the following figure.

Enter "Network" under the "Controller Properties" option and select "Enable Supervisor Mode"

Note: The ring network monitor function is enabled only when the PLC is in programming mode.

(4) Return to Logix Designer and make sure that none of the communication cards has encountered the following fault.

(5) Download the project to the PLC, bring the PLC online, and put it in programming mode.

3.6 Example 2 of PLC communication (communicate with ORMON PLC)

This example shows how to use an ORMON PLC (model: NX1P2-9024DT) to communicate with an Ethernet IP adapter module (through using the Sysmac Studio software as the configuration tool).

3.6.1 Hardware connections

The NX1P2-9024DT is not configured with a USB download port, and communication and

download between the PC and PLC is conducted through the built-in Ethernet IP port. In this case, a switch is needed in the experiment, and the connection method is as follows.

3.6.2 Network Configurator software setting

3.6.2.1 Launch Network Configurator software

Start the Network Configurator software as an administrator in the following

(x86)\OMRON\CX-One\NetworkConfigurator\Program\NetConfigurator.exe".

3.6.2.2 Load the FDS file

directory: "C:\Program Files

Select "EDS File"->"Install", and add EDS file: INVT_GD350_EthernetIP_V1.01. Click "Open", "Yes", and then click "Cancel".

Add "NX1P2" and "INVT" in the following location to the Ethernet IP bus. After these two device are added successfully, the bus shows two devices. The default IP addresses are "192.168. 250.1" and "192.168.250.2", and GD350 function codes P16.02–P16.05 are changed into 192, 168, 250 and 2 respectively.

3.6.2.3 Connection setting

Click "Option" → "Select Interface", and select "Ethernet I/F".

Click the "Connect" icon to select the corresponding network port, and click "OK".

Select "TCP:2", and click "OK",

Select "Use the existing network"→"EtherNet/IP_1", click "OK", and the PLC is connected successfully.

After the PLC is connected successfully, the blue indicator above the PLC device icon is on.

Click the "Device Property" icon, and the "Controller Information" tab pops up. You can switch the PLC status between "Program" and "Run" in the tab.

3.6.2.4 Modify IP address

Right click the device icon and select "Change Node Address" to change the PLC IP address.

3.6.3 Sysmac Studio software settings

3.6.3.1 Create a new project

Double click the

icon to open the software, select "New Project", enter "Project name",

select the device type, and click "Create".

After a new project is created completely, you can enter the following interface. Right click the device icon and select "Rename" to change the device name (you can choose not to change it).

3.6.3.2 Connection setting

Click "Controller" in the menu bar, and select "Communications setup".

Select "Ethernet-Hub Connection" as the connection method, enter the remote IP address "192.168.250.1", and click "Ethernet communication test". Click "OK" when the status bar shows "Test succeeded"

3.6.3.3 Set data labels

Select "Programming" \rightarrow "Data" \rightarrow "Global Variables" in the left menu bar, and add global

variables as needed. Note that you shall select "WORD" in the "Data Type" column and select "Input/Output" in the "Network Publish" column. Take "ODVA Basic speed control assembly" as an example, and create four global variables.

Click "Tools" in the top menu bar, and select "EtherNet/IP Connection Settings".

Double click "Built-in EtherNet/IP Port Settings".

Right click the blank area under "Tag Set", and select "Create New Tag Set".

The input tag set is named "INPUT", right click "INPUT" to select "Create New Tag", and add the input global variables to the "INPUT" tag set. Pay attention to the order of the data sequence.

Repeat above steps for "OUTPUT" tag set and "OUTPUT" tag.

3.6.4 Import and export data tags

3.6.4.1 Export data tags from Sysmac Studio

After data tags are set completely, click "Export" to export the data tag to a local folder, and save it as "GD350_test.csv" format.

3.6.4.2 Import data tags into Network Configurator

In the "Network Configurator" software, double click the PLC device icon, click "To/From File" in the lower right corner, and select "Import from File...".

Select the file "GD350_test.csv" exported from Sysmac Studio, and click "Open".

3.6.4.3 Data tag corresponding connection

Select the device "192.168.250.2" under the "Connections" tab, and click the Move Down button.

Double click the device "192.168.250.2", set the data input/output tags, and click "Regist".

3.6.5 PLC program downloading and online monitoring

3.6.5.1 Sysamc Studio downloading

Click the Online button (If the device name has been changed, the following interface will pop up, and you can click "No").

Click "Transfer to Controller" under the "Built-in EtherNet/IP Port Settings" tab.

Click "Yes".

Click the "Sync" function button.

Select the device "NX1P2", and click "Transfer To Controller".

Click "Yes".

Click "Close" when the "Controller" status in the lower right corner is two green lights.

3.6.5.2 Network Configurator downloading

Click the icon of "Download to Device", and click "Yes".

Click the icon of "Download to Network", and click "Yes".

3.6.5.3 Sysamc Studio online monitoring

Click the "Run" icon, turn the PLC to "Run Mode", and click "Yes".

Click "View" on the top menu bar, and select "Watch Tab Page".

Enter the variable name in the "Watch Tab Page" to monitor the value of the variable, and change the value in real time in the "Modify" box.

4 EtherCAT communication card

4.1 Overview

- Thanks for choosing INVT EC-TX508 communication cards. This manual describes the
 function specifications, installation, basic operation and settings, and information about
 the EtherCAT protocol. To ensure that you install and operate the product properly, read
 this manual and the communication protocol section in the VFD operation manual
 carefully before you use the product.
- This manual only describes how to operate the EC-TX508 communication card and the related commands but does not provide details about the EtherCAT protocol. For more information about the EtherCAT protocol, read the related specialized articles or books.
- EC-TX508 communication card is defined as an EtherCAT slave station communication card and is used on a VFD that supports EtherCAT communication.
- 4. The EtherCAT communication of this communication card supports two types of process data for reading data from and writing data to VFDs. They are PDOs (process data objects) and SDOs (service data objects) for reading data from and writing data to the object dictionary defined by the manufacturer.

4.2 Features

1. Supported functions

- Supports the EtherCAT COE 402 protocol.
- Supports automatic network address setting

2. Supported services

- Supports the PDO service
- Supports the SDO service
- Supports the object dictionary defined by the manufacturer
- > Allowing SDOs to read data from and write data to VFD function codes

3. Supported EtherCAT synchronization cycle

Table 4-1 Supported synchronization cycle

Item	Supported specification				
Synchronization cycle	250us				
	500us				

Item	Supported specification					
	1ms					
	2ms					

4. Communication ports

Standard RJ45 ports are used in EtherCAT communication. The communication card provides two RJ45 ports with transmission direction defined. Figure 4-1 shows the ports. IN (indicating input) and OUT (indicating ouput) are EtherCAT wiring network ports. Table 4-2 describes the port pins.

Figure 4-1 RJ45 ports

Table 4-2 RJ45 port pins

Pin	Name	Description
1	TX+	Transmit Data+
2	TX-	Transmit Data-
3	RX+	Receive Data+
4	n/c	Not connected
5	n/c	Not connected
6	RX-	Receive Data-
7	n/c	Not connected
8	n/c	Not connected

5. State indicators

The EtherCAT communication card provides four LED indicators and four net port indicators to indicate its states. Table 4-3 describes the state indicators.

Table 4-3 State indicators

Item	Color	Function description	
		The green indicator indicates EtherCAT running state.	
	Green	Init state: It remains off.	
RUN		Pre-OP state: It blinks off 0.2s and on 0.2s.	
		Safe-OP state: It blinks off 1s and on 0.2s.	
		OP state: It remains on.	
41.84	Red	The red indicator indicates EtherCAT fault state.	
ALM		No fault: It remains off.	

Item	Color	Function description						
		Init or Pre-OP state: It blinks off 0.2s and on 0.2s.						
		Safe-OP fault state: It blinks off 1s and on 0.2s.						
		OP fault state: It remains on.						
PWR	Red	3.3V power indicator						
		Off: Indicates that Ethernet connection is not established.						
Not most	Yellow	On: Indicates that Ethernet connection is established						
Net port indicator		successfully.						
	Green	Off: Without connection						
(IN)		On: Wilth connection but inactive						
		Blinks: With connection and active						
		Off: Indicates that Ethernet connection is not established.						
Natara	Yellow	On: Indicates that Ethernet connection is established						
Net port		successfully.						
indicator		Off: Without connection						
(OUT)	Green	On: Wilth connection but inactive						
		Blinks: With connection and active						

4.3 Electrical wiring

The EtherCAT network usually consists of a master station (PLC) and several slave stations (drives or bus extension terminals). Each EtherCAT slave station are configured with two standard Ethernet interfaces, and the electrical wiring diagram is shown in Figure 4-2.

Figure 4-2 Electrical wiring diagram for a linear topology

4.4 Communication

4.4.1 CoF reference model

Figure 4-3 CoE reference model

CoE network reference model consists of the data link layer and application layer. The data link layer is responsible for EtherCAT communication protocol. CANopen drive Profile (DS402) communication rules are embedded in the application layer. The object dictionary in CoE includes the parameters, application data, and PDO mapping configuration information.

PDOs are composed of the objects (in the object dictionary) that can perform PDO mapping. The content in PDO data is defined by PDO mapping. PDO data is periodically read and written, which does not require searching the object dictionary. Mail box communication (SDO) is not periodic, which requires searching the object dictionary.

Note: To parse SDO and PDO data correctly on the EtherCAT data link layer, it is necessary to configure FMMU and Sync Manager (SM).

		y, io manago, comigaran	
Synchronization management	Configuration	Size	Start address
Sync Manager 0	Assigned to receive SDO	512byte	0x1000
Sync Manager 1	Assigned to send SDO	512byte	0x1400
Sync Manager 2	Assigned to receive PDO	128byte	0x1800

Table 4-4 EtherCAT Sync Manager configuration

Synchronization management	Configuration		Start address	
Sync Manager 3	Assigned to send PDO	128byte	0x1C00	

4.4.2 EtherCAT slave station information

EtherCAT slave station information file (.xml) is read by the master station to construct the master and slave station configuration. This file contains mandatory information about EtherCAT communication settings. INVT provides this file EC-TX508 100.xml.

4.4.3 EtherCAT state machine

EtherCAT state machine is used to describe the states and state change of slave station applications. Generally, the master station sends a state change request, while the slave station responds. The state change flow is shown in the following figure.

Figure 4-4 EtherCAT state machine flowchart

Table 4-5 EtherCAT state machine description

State	Description					
Init	Both SDO and PDO communication are unavailable.					
Init to Pre-Op	The master station configures the data link layer address and SM channel for SDO communication. The master station initializes DC synchronization information. The master station requests the jump to the Pre-Op state. The master station configures the application layer control register. The slave station checks whether the mailbox is initialized properly.					

State	Description					
Pre-Op	SDO communication is available but PDO is unavailable.					
Pre-Op to Safe-Op	The master station configures the SM and FMMU channels for PDO communication. The main station configures PDO mapping through SDO communication. The master station requests the jump to the Safe-Op state. The slave station checks whether the PDO and DC are configured correctly.					
Safe-Op	SDO communication is available. Communication of receiving PDOs is available, but that of sending PDOs is unavailable, in the Safe state.					
Safe-Op to Op	The master station requests the jump to the Op state.					
Ор	Both SDO and PDO communication are available.					

4.4.4 PDO mapping

The process data of an EtherCAT slave station is composed of SM channel objects. Each SM channel object describes the consistent area of the EtherCAT process data and includes multiple PDOs. An EtherCAT slave station with the application control function shall support PDO mapping and reading of SM PDO assigned objects.

The master station can select objects from the object dictionary to perform PDO mapping. PDO mapping configuration is located in the range of 1600h–1603h (RxPDOs: receiving PDOs) and range of 1A00h–1A03h (TxPDOs: sending PDOs) in the object dictionary. The PDO mapping method is shown in the following figure.

Figure 4-5 PDO mapping method

In addition to PDO mapping, EtherCAT process data switching needs to assign PDOs to SM channels. The relationship between PDOs and SM channels is established through SM PDO assigned objects (1C12h and 1C13h). The mapping between SM channels and PDOs is shown in the following figure.

Figure 4-6 SM PDO assignment

Default PDO mapping (Position, Velocity, Torque, Torque limit, Touch probe):

RxPDO (0x1600)	Control word (0x6040	Target Position (0x607A)	Target Velocity (0x60FF)	Target Torque (0x6071)		Mode of Operation (0x6060)	Profile velocity (0x6081)	Touch Probe Function (0x60B8)
TxPDO (0x1A00)	Statusw ord (0x6041	Position Actual Value (0x6064)	Speed Actual Value (0x606C)	Torque Actual Value (0x6077)	Following Error Actual Value (0x60F4)	wode or	Error Code (0x603F)	Touch Probe Value (0x60BA)

4.4.5 DC-based network synchronization

The DC (distributed clock) can enable all EtherCAT devices to use the same system time so as to control the synchronous execution of all device tasks. In the EtherCAT network, the clock with the DC function of the first slave station connected to the master station is used as the reference clock across the network. The other slave stations and master station use this reference clock for synchronization.

Free-Run: The running cycle and communication cycle of each servo drive are not related to the communication cycle of the master station.

DC Mode: The servo drive performs synchronization through Sync0 of the master station.

4.5 CiA402 device protocol

The master station controls the drive through the control word (0x6040) and obtains the current state of the drive by reading the status word (0x6041). The servo drive implements motor control based on master station control commands.

4.5.1 CoE state machine

Figure 4-7 CANopen over EtherCAT state machine

Status	Description
Not Ready to Switch On	The drive is in the initialization process.
Switch On Disabled	Drive initialization completes.
Ready to Switch On	The drive is preparing to enter the Switch On state, but the motor is not excited.
Switched On	The drive is in the ready state, and the main circuit power supply is normal.
Operation Enable	The drive is enabled and controls the motor based on the control mode.
Quick Stop Active	The drive stops in the set manner.
Fault Reaction Active	When detecting an alarm, the drive stops in the set manner, but the motor still has the exciting signal.
Fault	The drive is in the faulty state, and the motor has no exciting signal.

6040h control word includes:

- 1. Bit for status control;
- 2. Bit related to control mode;
- 3. Factory-defined control bit.

The bits of 6040h are described as follows.

15	11	10	9	8	7	6	4	3	2	1	0
	ctory fine	Rese	erved	Suspend	Fault reset		ration ode	Servo running	Quick stop	Switch on main circuit	Servo being running
(0	0)	0	М		0	М	М	М	М
M	1SB				LSB						

BITS 0-3 AND 7 (used for status control):

Command	Fault reset	Enable operation	Quick stop	Enable voltage	Switch on	Transitions
Shutdown	0	X	1	1	0	2,6,8
Switch on	0	0	1	1	1	3*
Switch on	0	1	1	1	1	3**
Disable voltage	0	X	X	0	Χ	7,9,10,12
Quick stop	0	X	0	1	Χ	7,10,11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4,16
Fault reset	0-1	X	Х	Χ	Χ	15

BITS 4, 5, 6 AND 8 (related to control mode)

	Operation mode		
Bit	Profile position mode	Profile velocity mode	Homing mode
4	New set-point	Reserved	Homing operation start
5	Change set immediately	Reserved	Reserved
6	Abs/rel	Reserved	Reserved
8	Halt	Halt	Halt

Control word is set to 0x0F for enabling the drive. Otherwise, the drive will stop. When a fault occurs, if bit 7 of the control word is set to 1, the reset command is enabled.

6041h status word includes:

- 1. Current status bit of drive;
- 2. Status bit related to control mode;
- 3. Factory-defined status bit.

The bits of 6041h are described as follows:

Bit	Description	M/O
0	Ready to switch on	М
1	Switched on	М
2	Operation enabled	М
3	fault	М
4	Voltage enable	М
5	Quick stop	М
6	Switch on disabled	М
7	Warning	0
8	Manufacture specific	0
9	Remote	М
10	Target reached	М
11	Internal limit active	М
12-13	Operation mode specific	0
14-15	Manufacturer specific O	

BIT0-3, 5, AND6:

Value(binary)	State
xxxx xxxx x0xx 0000	Not ready to switch on
xxxx xxxx x1xx 0000	Switch on disabled
xxxx xxxx x01x 0001	Ready to switch on
xxxx xxxx x01x 0011	Switched on
xxxx xxxx x01x 0111	Operation enabled
xxxx xxxx x00x 0111	Quick stop active
xxxx xxxx x0xx 1111	Fault reaction active
xxxx xxxx x0xx 1000	Fault

BIT4: Voltage enable, when this bit is 1, it indicates that the main circuit power supply is normal.

BIT9: Remote, when this bit is 1, it indicates that the slave station is in the OP state, and the master station can control the drive through PDO.

BIT10: Target reached, this bit differs in meaning under different control modes. When this bit is 1, in cyclic synchronous position mode, it indicates that target position is reached, while in cyclic synchronous velocity mode, it indicates that reference speed is reached; in homing mode, it indicates that homing is completed.

BIT14: When this bit is 1, it indicates motor zero-speed state.

BIT7-8, BIT11-13, and BIT15; Reserved.

4.5.2 Device running mode

Set P00.01=2 (command running channel), P00.02=3 (EtherCAT communication channel), and P16.18 Communication timeout. Position mode and homing mode are achieved only when the drive is in the closed-loop mode.

6.5.2.1 Cyclic Synchronous Position Mode

- 1. Set 【6060h: Mode of operations】 to 8 (Cyclic synchronous position mode).
- 2. Set 【6040h: Control word】 to enable the drive (set it to 0x0F for enabling).
- 3. Set 【607Ah: Target position】 to the target position (unit: user unit).
- 4. Query for 【6064h: Position actual value】 to obtain actual position feedback of the motor.
- Query for 【6041h: Status word】 to obtain the status feedback of the drive (following error, target reached and internal limit active).
- For function details, see function parameters in group P21 in GD350 and the specific function commissioning instructions in the basic operations in the manual.

6.5.2.2 Profile Position Mode

- 1. Set 【6060h: Mode of operations】 to 1 (Profile Position Mode).
- 2. Set tens of P21.00 (Position command source) to 1 (Digital position), and set P21.16 (Digital positioning mode).
- 3. Set 【6040h: Control word】 to enable the drive (set it to 0x0F for enabling).
- 4. Set 【607Ah: Target position】 to the target position (unit: user unit).
- 5. Query for 【6064h: Position actual value】 to obtain actual position feedback of the motor.

- Query for 【6041h: Status word】 to obtain the status feedback of the drive (following error, target reached and internal limit active).
- For function details, see function parameters in group P21 in GD350 and the specific function commissioning instructions in the basic operations in the manual.

6.5.2.3 Homing Mode

- 1. Set 【6060h: Mode of operations】 to 6 (homing mode).
- 2. Set P22.00.Bit0=1 to enable the spindle positioning, and set P22.03-P22.06.
- 3. Set 【6040h: Control word】 to enable the drive (set it to 0x0F for enabling). Homing operation start (Bit4) changes from 0 to 1 (Control word Bit4 is set to 1). However, the change from 1 to 0 will terminate Homing.
- 4. The motor gueries the limit switch and Home switch to complete Homing.
- Query 【6041h: Status word】 to obtain the status feedback of the drive (Homing error, Homing attained, and Target reached).
- For function details, see function parameters in group P22 in GD350 and the specific function commissioning instructions in the basic operations in the manual.

6.5.2.4 Cyclic Synchronous Velocity Mode

- 1. Set 【6060h: Mode of operations】 to 9 (Cyclic synchronous velocity mode).
- 2. Set 【6040h: Control word】 to enable the drive (set it to 0x0F for enabling) and start the motor for running.
- 3. Set 【60FFh: Target velocity】 to set the target rotation speed (unit: rpm), which corresponds to P00.10 (a positive value indicates forward rotation and a negative value indicates reverse rotation).
- 4. Query 【6041h: Status word 】 to obtain the status feedback of the drive (Speed zero, Max slippage error, Target reached, and Internal limit active).

6.5.2.5 Cyclic Synchronous torque Mode

- 1. Set 【6060h: Mode of operations】 to 10 (Cyclic synchronous torque mode).
- 2. Set the VFD to torque control (P03.32=1).
- 3. Set 【6040h: Control word】 to enable the drive (set it to 0x0F for enabling) and start the motor for running.
- 4. Set 【6071h: Target torque】 to set the target torque.

Query 【6041h: Status word】 to obtain the status feedback of the drive (Speed zero, Max slippage error, Target reached, and Internal limit active).

4.6 Function code modification

Index	Sub-index	Description	Permission	Data type	Default
		Read			
2000h	0	function	RW	UINT32	0
		codes			

Bits 16-31: Read function code addresses

Rits 00-15: No function

Example of read operation: Read the keypad-set frequency (value of P00.10)

SDO operates 2000h to write 0x00A00000. View the response value of 2001h read operation.

2001h	0	Read response	RO	UINT32	0
-------	---	---------------	----	--------	---

Bits 16-31: 0x0001 read success

Bits 00-15: Parameter value read by 2000h

Bits 16-31: 0x0003 read error

Bits 00-15: Error codes

0x0002 illegal data address

0x0009 password protection

2002h 0 Write function RW UINT32 codes	0	0

Bits 16-31: Write function codes

Bits 00-15: Written data

Write operation example: Modify the value of P00.10 to 50.00.

SDO operates 2002h to write 0x000A1388. View the response value of 2003h write operation.

2003h	0	Write response	RO	UINT32	0

Bits 16-31: 0x0001 write success

Bits 00-15: Parameter value written by 2002h

Bits 16-31: 0x0003 write error

Bits 00-15: Error codes

0x0002 illegal data address

0x0003 illegal data value

0x0007 read-only parameter

0x0008 the parameter is unchangeable during running

4.7 Example of TwinCAT2 application

This example shows how to use TwinCAT2 as the main station to communicate with the EtherCAT module of the VFD.

- Install TwinCAT2 software
- Copy the EtherCAT configuration file (EC-TX508_100.xml) of GD350 to the installation directory of TwinCAT2 ("C:\TwinCAT\lo\EtherCAT").
- 3. Open TwinCAT2

4. Install the network card drive

Open the menu as shown in the above figure, select "Show Realtime Ethernet Compatible Devices...", pop up a dialog box as shown in the following figure, select the local area network card, and click "Install". After the network card is installed successfully, it will shown under the menu "Installed and ready to use devices". (Note: Please choose the network cards configured with Intel chips)

5. Set TwinCAT2 to be in the configuration mode

6 Scan device

Select "I/O Devices" menu, and right-click to select "Scan Devices..." to scan the device.

Pop up the following dialog box, and select "OK".

Pop up the following dialog box, and select "OK".

Pop up the following dialog box, and select "Yes".

Pop up the following dialog box, and select "Yes". Then the device enters the free running mode.

The following figure shows "Box3" which is the slave device scanned, and view that the device enters the "OP" state.

Process data input and output

Select "DO Outputs" menu, and there are data sent from the master station to the VFD, which can be used to set commands and rotation speed.

Select "DI Intputs" menu, and there are data sent from the VFD to the master station, which can be used to return the statuses and and rotation speed.

8. SDO data operation

Select "CoE-Online" menu, as shown in the figure below. Read the VFD function code parameters through index 0x2000, and double click 0x2000 to pop up a dialog box. Write the parameter address in the dialog box, and click "OK". The returned results are stored in index 0x2001. Similarly, Write the VFD function code parameters through index 0x2002, and the written results are stored in index 0x2003.

5 Modbus TCP communication card

5.1 Overview

- 1. Thanks for choosing INVT Modbus TCP communication cards. This manual describes the function specifications, installation, basic operation and settings, and information about the network protocol. To ensure that you install and operate the product properly, read this manual and the communication protocol section in the VFD operation manual carefully before you use the product.
- This manual only describes how to operate the Modbus TCP communication card and the related commands but does not provide details about the Modbus TCP protocol. For more information about the Modbus TCP protocol, read the related specialized articles or books.
- This communication card is defined as a Modbus TCP slave station communication card and is used on a VFD that supports Modbus TCP communication.
- The communication card supports the star-shaped network topology and linear network topology.
- The communication card supports 32 inputs/outputs to read and write process data, read state data, and read and write function parameters of a VFD.

5.2 Features

1. Supported functions

- > Supports the Modbus TCP protocol and Modbus TCP slave stations.
- Provides two Modbus TCP ports and supports the 10/100M full/half-duplex operation
- Supports the star-shaped network topology and linear network topology.

2. Supported communication types

Modbus TCP uses TCP/IP for information control and transmission over the Ethernet, allowing the sending of explicit packets, namely, point-to-point messages that are not time critical. The Modbus TCP application layer adopts the Modbus protocol, which is also used by Modbus RTI.

Same as Modbus RTU, Modbus TCP requires the PLC/PC to send the read or write commands, and the communication card returns the operation result after data forwarding to complete the data transmission.

3. Communication ports

Standard RJ45 ports are used in Modbus TCP communication. The communication card provides two RJ45 ports with no transmission direction defined, and therefore you can insert a cable into the port without regard to its direction. Figure 5-1 shows the ports, and Table 5-1 describes the functions of the ports.

Figure 5-1 Two standard RJ45 ports

Table 5-1 Standard RJ45 port pins

Pin	Name	Description
1	TX+	Transmit Data+
2	TX-	Transmit Data-
3	RX+	Receive Data+
4	n/c	Not connected
5	n/c	Not connected
6	RX-	Receive Data-
7	n/c	Not connected
8	n/c	Not connected

4 State indicators

The Modbus TCP communication card provides 4 LED indicators and 4 network port indicators to indicate its states. Table 5-2 describes the state indicators

Table 5-2 State indicators

LED	Color	State	Description
		On	Indicating that the card and VFD identify each
			other.
LED1	Croon	Dlinking (1Uz)	Indicating that the card and VFD
LEDI	Green	Blinking (1Hz)	communicate normally.
		Off	Indicating that the card and VFD
			communicate improperly.
			The communication between the card and
LED2 Gr	Green	On	PLC is online and data interchange is
		allowed.	

LED	Color	State	Description			
		Blinking (1Hz)	Indicating IP address conflict between the card and PLC.			
		Off	Indicating that communication between the card and PLC is offline.			
		On	Modbus TCP has not received valid data.			
LED3	Red	Blinking (1Hz)	Indicating that the packet address is unused or undefined.			
		Blinking (8Hz)	Indicating incorrect packet address.			
		Off	No fault			
LED4	Red	On	3.3V power indicator			
Network	Yellow	On	Link indicator, indicating successful Ethernet connection.			
port indicator	reliow	Off	Link indicator, indicating that Ethernet connection is not established.			
Network	Croon	On	ACK indicator, indicating that data interchange being performed.			
port indicator	Green	Off	ACK indicator, indicating that data interchange is not be performed.			

5.3 Electrical wiring

The Modbus TCP communication card provides standard RJ45 ports and supports the linear and star topologies. Figure 5-2 and Figure 5-3 show the electrical wiring diagrams for different topologies.

Use CAT5, CAT5e, and CAT6 network cables for electrical wiring. When the communication distance is greater than 50 meters, use high-quality network cables that meet the national standards.

Figure 5-2 Electrical wiring diagram for a linear topology

Figure 5-3 Electrical wiring diagram for a star topology

Note: An Ethernet switch must be available when the star topology is used.

5.4 Communication

5.4.1 Communication settings

The Modbus TCP communication card can function as only the Modbus TCP slave station. Before communication, set Goodrive350 function codes, including:

Communication station address. IP address and subnet mask for the card

The default station address, IP address, and subnet mask for each communication card are 1, 192.168.0.1, and 255.255.255.0 respectively. You can change them to the address of a network segment.

2. Control mode

If you want to control the VFD with the communication card, set the control mode to Modbus TCP communication control. To be specific, set P00.01=2 (communication as the running command channel) and set P00.02=0 (Modbus TCP communication channel) to control VFD start and stop. If you want to set a value through Modbus TCP communication, change the control way of corresponding function codes to Modbus TCP communication. Appendix B lists related function codes.

Note: After the setting, the card can communicate normally. If you want to control the VFD with the card, set related function codes to enable Modbus TCP communication control.

5.4.2 Packet format

Table 5-3 describes the structure of a TCP communication packet.

Table 5-3 Structure of a TCP communication packet

MAC-layer packet header	IP-layer packet header	TCP-layer packet header	Valid data	Packet trailer
14 bytes	20 bytes	20 bytes	0-1488 bytes	4 bytes

5.4.3 Modbus TCP communication

The application layer of the Modbus TCP communication card supports the Modbus protocol. The Modbus TCP protocol packet is located in the valid data area of the TCP communication packet. It consists of two parts. The first part is MBAP (packet header, occupying 7 bytes), and the second part is PDU (protocol data unit whose length is variable), as shown in Table 5.4.

Table 5-4 Modbus TCP protocol packet

	PDU				
Transaction identifier	Protocol identifier	Length field	Unit identifier	Function Code	Data
2 bytes	2 bytes	2 bytes	1 byte	1 byte	n bytes
Sequence number of packets, incremented by 1 after each communication for distinguishing between different packets	0000=Modbu s-TCP protocol	Data length	Device address (station number)	Modbus function code	Includes VFD function codes and data, and the length is variable.

Through the above packets, you can set the VFD reference parameters, monitor the status value, send control commands, monitor the running status of the VFD, and read and write the VFD function codes. For specific operations, see the follow-up.

Parameter description:

Unit identifier: Slave station number (1-247).

Function code: Modbus function codes, as shown in Table 5.5.

Table 5-5 Modbus function codes

Function code	Description
0x01	Read coils
0x05	Write single coil
0x0F	Write multiple coils
0x02	Read discrete quantity
0x04	Read input register

Function code	Description
0x03	Read holding register
0x06	Write single holding register
0x10	Write multiple holding registers

Data: The data of the first word is the address of the VFD function code, for example, P00.00 corresponds to the address of 0000h, and the subsequent data is the value to be read and written

Packet examples:

(1) Command code 03H, reading N words (continuously up to 16 words)

The command code 03H is used by the master to read data from the VFD. The count of data to be read depends on the "data count" in the command. A maximum of 16 pieces of data can be read. The addresses of the read parameters must be contiguous. Each piece of data occupies 2 bytes, that is, one word. The command format is presented using the hexadecimal system (a number followed by "H" indicates a hexadecimal value). One hexadecimal value occupies one byte.

The command is used to read parameters and operation status of the VFD.

For example, starting from the data address of 0004H, to read two contiguous pieces of data (that is, to read content from the data addresses 0004H and 0005H) of the VFD whose address is 01H, the frame structures are described in the following.

	Request	0001	0000	0006	01	03	0004	0004
	Meaning		MBA	ŀΡ		Function code	Write address	Number of bytes
Example	Response	0001	0000	0007	01	03	04	1388 0000
	Meaning		MBA	ΛP		Function code	Number of bytes	Data

From the response, the data in 0004H is 1388H (50.00Hz), and that in 0005H is 0000H (00.00Hz).

(2) Command code 06H, writing one word

This command is used by the master to write data to the VFD. One command can be used to write only one piece of data. It is used to modify the parameters and running mode of the VFD.

For example, to write 5000 (1388H) to 0004H of the VFD whose address is 02H, the frame structures are described in the following.

	Request	0001	0000	0006	02	06	0004	1388
F	Meaning		MBAF)		Function code	Write address	Data
Example	Response	0001	0000	0006	02	06	0004	1388
	Meaning	MBAP				Function code	Write address	Data

(3) Command code 10H, continuous writing

The command code 10H is used by the master to write data to the VFD. The quantity of data to be written is determined by "Data count", and a maximum of 16 pieces of data can be written

For example, to write 5000 (1388H) and 50 (0032H) respectively to 0004H and 0005H of the VFD whose slave address is 02H, the frame structures are described in the following.

Exa	Request	0001	0000	000B	02	10	0004	0002	04	1388 0032
			MBA	AΡ		Function code	Write address	Number of registers	Number of bytes	Data
mp	Response	0001	0000	0006	02	10	0004	0002		
	Meaning		MBAP			Function code	Write address	Number of registers		

5.4.4 Data address definition

This section describes the address definition of communication data. The addresses are used for controlling the running, obtaining the status information, and setting function parameters of the VFD.

The address of a function code consists of two bytes, with the high-order bit on the left and low-order bit on the right. The high-order bit ranges from 00 to ffH, and the low-order bit also ranges from 00 to ffH. The high-order bit is the hexadecimal form of the group number before the dot mark, and low-order bit is that of the number behind the dot mark. Take P14.00 as an example: The group number is 14, that is, the high-order bit of the parameter address is the hexadecimal form of 0E; and the number behind the dot mark is 00, that is, the low-order bit is the hexadecimal form of 00. Therefore, the function code address is 0E00H in the hexadecimal form. For example, the parameter address of P14.03 is 0E03H.

Function code	Name	Parameter description	Setting range	Default value
	Local			
P14.00	communication	1–247	1-247	1
	address			

Function code	Name	Parameter description	Setting range	Default value
P14.03	Communication response delay	0–200ms	0–200	5

Note:

- The parameters in the P99 group are set by the manufacturer and cannot be read or modified. Some parameters cannot be modified when the VFD is running; some cannot be modified regardless of the VFD status. Pay attention to the setting range, unit, and description of a parameter when modifying it.
- The service life of the Electrically Erasable Programmable Read-Only Memory (EEPROM) may be reduced if it is frequently used for storage. Some function codes do not need to be stored during communication. The application requirements can be met by modifying the value of the on-chip RAM, that is, modifying the MSB of the corresponding function code address from 0 to 1. For example, if P00.07 is not to be stored in the EEPROM, you need only to modify the value in the RAM, that is, set the address to 8007H. The address can be used only for writing data to the on-chip RAM, and it is invalid when used for reading data.

Description of other function addresses

In addition to modifying the parameters of the VFD, the master can also control the VFD, such as starting and stopping it, and monitoring the operation status of the VFD. The following table describes other function parameters.

Function	Address	Data description	R/W
		0001H: Forward running	
		0002H: Reverse running	
		0003H: Forward jogging	
Communication- based control	2000H	0004H: Reverse jogging	D AA/
command	2000H	0005H: Stop	R/W
Command		0006H: Coast to stop (emergency stop)	
		0007H: Fault reset	
		0008H: Jogging to stop	
0	2001H	Communication-based frequency setting (0–Fmax, unit: 0.01 Hz)	R/W
Communication- based value	2002H	PID setting, range (0–1000, 1000 corresponding to 100.0%)	R/W
setting	2003H	PID feedback, range (0–1000, 1000 corresponding to 100.0%)	R/W

Function	Address	Data description	R/W
	2004H	Torque setting (-3000—+3000, 1000 corresponding to 100.0% of the motor rated current)	R/W
	2005H	Setting of the upper limit of the forward running frequency (0–Fmax, unit: 0.01 Hz)	R/W
	2006H	Setting of the upper limit of the reverse running frequency (0–Fmax, unit: 0.01 Hz)	R/W
	2007H	Upper limit of the electromotion torque (0–3000, 1000 corresponding to 100.0% of the motor rated current)	R/W
	2008H	Upper limit of the brake torque (0–3000, 1000 corresponding to 100.0% of the motor rated current)	R/W
	2009Н	Special control command word: Bit0-1: =00: Motor 1 =01: Motor 2 Bit2: =1 Enable speed/torque control switchover =0: Disable speed/torque control switchover Bit3: =1 Clear electricity consumption =0: Not clear electricity consumption Bit4: =1 Pre-excitation; =0: Disable pre-excitation Bit5: =1 DC brake =0: Disable DC brake	R/W
	200AH	Virtual input terminal command, range: 0x000–0x3FF Corresponding to S8/S7/S6/S5/HDIB/HDIA/S4/ S3/ S2/S1	R/W
	200BH	Virtual output terminal command, range: 0x00–0x0F Corresponding to local RO2/RO1/HDO/Y1	R/W
	200CH	Voltage setting (used for V/F separation) (0–1000, 1000 corresponding to 100.0% of the motor rated voltage)	R/W
	200DH	AO output setting 1 (-1000-+1000, 1000 corresponding to 100.0%)	R/W
	200EH	AO output setting 2 (-1000-+1000, 1000 corresponding to 100.0%)	R/W

Function	Address	Data description		R/W
		0001H: Forward running		
		0002H: Reverse running		
VFD status word	2100H	0003H: Stopped		R
1	2100H	0004H: Faulty		ĸ
		0005H: POFF		
		0006H: Pre-excited		
VFD status word 2	2101H	Bit0: =0: Not ready to run =1: Ready to run Bi1-2: =00: Motor 1 =01: Motor 2 Bit3: =0: Asynchronous motor =1: Synchronous motor Bit4: =0: No overload alarm =1: Overload alarm Bit5-Bit6: =00: Keypad-based control =01: Terminal-based control =10: Communication-based control Bit7: Reserved Bit8: =0: Speed control =1: Torque control Bit9: =0: Non position control =1: Position control Bit11-Bit10: =0: Vector 0 =1: Vector 1 =2: Closed-loop vector =3: Space voltage vector		R

Set frequency	3001H	0-Fmax (Unit: 0.01Hz)	Compatible	R
Bus voltage	3002H	0.0-2000.0V (Unit: 0.1V)	with	R
Output voltage	3003H	0-1200V (Unit: 1V)	CHF100A	R
Output current	3004H	0.0-3000.0A (Unit: 0.1A)	and CHV100	R
Rotating speed	3005H	0–65535 (Unit: 1RPM) communicati		R
Output power	3006H	-300.0–300.0% (Unit: 0.1%) on		R
Output torque	3007H	-250.0-250.0% (Unit: 0.1%) addresses		R
Closed-loop setting	3008H	-100.0–100.0% (Unit: 0.1%)		R

Function	Address	Data descriptio	n	R/W
Closed-loop feedback	3009H	-100.0–100.0% (Unit: 0.1%)		R
Input state	300AH	000–3F Corresponding to the local HDIB/ HDIA/S4/S3/S2/S1		R
Output state	300BH	000–0F Corresponding to the local RO2/RO1/HDO/Y1		R
Analog input 1	300CH	0.00-10.00V (Unit: 0.01V)		R
Analog input 2	300DH	0.00-10.00V (Unit: 0.01V)		R
Analog input 3	300EH	-10.00–10.00V (Unit: 0.01V)		R
Analog input 4	300FH			R
Read input of HDIA high-speed pulse	3010H	0.00–50.00kHz (Unit: 0.01Hz)		R
Read input of HDIB high-speed pulse	3011H			R
Read current step of multi-step speed	3012H	0–15		R
External length	3013H	0–65535		R
External count value	3014H	0–65535		R
Torque setting	3015H	-300.0–300.0% (Unit: 0.1%)		R
Identification code	3016H			R
Fault code	5000H			R

The Read/Write (R/W) characteristics indicate whether a function can be read and written. For example, "Communication-based control command" can be written, and therefore the command code 6H is used to control the VFD. The R characteristic indicates that a function can only be read, and W indicates that a function can only be written.

Note: Some parameters in the preceding table are valid only after they are enabled. Take the running and stop operations as examples, you need to set "Running command channel" (P00.01) to "Communication", and set "Communication running command channel" (P00.02) to the Modbus communication channel. For another example, when modifying "PID setting",

you need to set "PID reference source" (P09.00) to Modbus communication.

The following table describes the encoding rules of device codes (corresponding to the identification code 2103H of the VFD).

Eight high-order bits of code	Meaning	Eight low-order bits of code	Meaning
	GD	0x08	GD35 vector VFD
		0x09	GD35-H1 vector VFD
01		0x0a	GD300 vector VFD
01		0xa0	GD350 vector VFD
		0xa1	GD350-UL vector VFD
		0xa2	GD350A vector VFD

5.4.5 Fieldbus scale

In practical applications, communication data is represented in the hexadecimal form, but hexadecimal values cannot represent decimals. For example, 50.12 Hz cannot be represented in the hexadecimal form. In such cases, we can multiply 50.12 by 100 to obtain an integer 5012, and then 50.12 can be represented as 1394H (5012 in the decimal form) in the hexadecimal form

In the process of multiplying a non-integer by a multiple to obtain an integer, the multiple is referred to as a fieldbus scale.

The fieldbus scale depends on the number of decimals in the value specified in "Detailed parameter description" or "Default value". If there are n decimals in the value, the fieldbus scale m is the nth-power of 10. Take the following table as an example, m is 10.

Function code	Name	Description	Setting range		
P01.20	Wake-up-from-sl eep delay	0.0–3600.0s (valid when P01.15 is 2)	0.00 - 3600.0	0.0s	
P01.21		0: Disable	0 - 1	0	
	power failure	1: Enable			

The value specified in "Setting range" or "Default" contains one decimal, so the fieldbus scale is 10. If the value received by the upper computer is 50, the value of "Wake-up-from-sleep delay" of the VFD is 5.0 (5.0=50/10).

To set the "Wake-up-from-sleep delay" to 5.0s through Modbus communication, you need first to multiply 5.0 by 10 according to the scale to obtain an integer 50, that is, 32H in the hexadecimal form.

After receiving the command, the VFD converts 50 into 5.0 based on the fieldbus scale, and then sets "Wake-up-from-sleep delay" to 5.0s.

5.4.6 Error message response

Operation errors may occur in communication-based control. For example, some parameters can only be read, but a write command is transmitted. In this case, the VFD returns an error message response.

Error message responses are sent from the VFD to the master. The following table describes the codes and definitions of the error message responses.

Code	Name	Description
01H	Invalid command	The command code received by the upper computer is not allowed to be executed. The possible causes are as follows: • The function code is applicable only on new devices and is not implemented on this device. • The slave is in the faulty state when processing this request.
02H	Invalid data address	For the VFD, the data address in the request of the upper computer is not allowed. In particular, the combination of the register address and the number of the to-be-transmitted bytes is invalid.
03H	Invalid data value	The received data domain contains a value that is not allowed. The value indicates the error of the remaining structure in the combined request. Note: It does not mean that the data item submitted for storage in the register includes a value unexpected by the program.
04H	Operation failure	The parameter is set to an invalid value in the write operation. For example, a function input terminal cannot be set repeatedly.
05H	Password error	The password entered in the password verification address is different from that set in P07.00.
06H	Data frame error	The length of the data frame transmitted by the upper computer is incorrect, or in the RTU format, the value of the CRC check bit is inconsistent with the CRC value calculated by the lower computer.
07H	Parameter read-only	The parameter to be modified in the write operation of the upper computer is a read-only parameter.

Code	Name	Description		
08H	Parameter cannot be modified in running	The parameter to be modified in the write operation of the upper computer cannot be modified during the running of the VFD.		
09H	Password protection	A user password is set, and the upper computer does not provide the password to unlock the system when performing a read or write operation. The error of "system locked" is reported.		

When returning a response, the slave device uses a function code domain and fault address to indicate whether it is a normal response (no error) or exception response (some errors occur). In a normal response, the device returns the corresponding function code and data address or sub-function code. In an exception response, the device returns a code that is equal to a normal code, but the first bit is logic 1.

For example, if the master device transmits a request message to a slave device for reading a group of function code address data, the code is generated as follows:

0 0 0 0 0 0 1 1 (03H in the hexadecimal form)

For an exception response, the following code is returned:

1 0 0 0 0 0 1 1 (83H in the hexadecimal form)

In addition to the modification of the code, the slave device returns a byte of exception code that describes the cause of the exception. After receiving the exception response, the typical processing of the master device is to transmit the request message again or modify the command based on the fault information.

5.5 Example of PLC communication

This example shows how to use SIEMENS PLC (S7-1200) to communicate with Modbus TCP communication extension card (through the TIA Portal V13 software), and Modbus TCP is not configured with device description file.

Use TIA Portal V13 software to add a Modbus TCP block.

Open TIA Portal V13, and create a new project as shown in the following figure.

After a new project is created, click "Project view" in the lower left corner, and double click "Add new device" in the interface, as shown in the following figure.

Select the correct PLC model, and click "OK" (PLC models used by our company are shown in the following figure).

Click "Program blocks", and double click "Main[OB1]" to open the programming interface, as shown in the following figure.

Select "Others" under the "Communication" bar on the right, then select "MODBUS TCP" → "MB CLIENT", as shown in the following figure.

Add 2 data blocks in "Add new block" under "Program blocks", namely "MB_CLIENT_TCON" and "MB_Client_Data", as shown in the following figure.

Set the variables of these two data blocks respectively, as shown in the following figure.

(1) MB_CLIENT_TCON data block

(2) MB_Client_Data data block

Uncheck the "Optimized block access" of the block, as shown in the following figure.

Double click "Show all" under "PLC tags", and create variables, as shown in the following figure.

PLC tags					
		Name	Tag table	Data type	Address
1	411	MB_Client_REQ	Default tag table	Bool	%M10.0
2	11	MB_Client_DISCONNET	Default tag table	Bool	%M10.1
3	11	MB_Client_MODE	Default tag table	USInt	%MB20
4	11	MB_Client_ADDR	Default tag table	Word	%MW100
5	40	MB_Client_LEN	Default tag table	UInt	%MW102
6	40	MB_Client_DONE	Default tag table	Bool	%M10.2
7	40	MB_Client_BUSY	Default tag table	Bool	%M10.3
8	40	MB_Client_ERROR	Default tag table	Bool	%M10.4
9	40	MB_Client_STATUS	Default tag table	Word	%MW104
10	40	AUTO_RUN	Default tag table	Bool	%M0.0
11	40	RUN_TERM	Default tag table	Bool	%10.0

Configure the Modbus TCP block as shown in the following figure.

Double click "Device configuration", right click the network port to select "Properties", set the following parameters in the pop-up interface, and modify the local Ethernet network segment to be the same as the following network segment.

Write the PLC program as follows.

```
"MB_CLIENT
         TCON".TCON.
      RemoteAddress.
            ADDR[4] __ IP OCTET_4
         "MB_CLIENT_
         TCON" TCON
         RemotePort ___ IP_PORT
             %MB20
         "MB_Client_
MODE" —
                      MB MODE
            %MW100
    "MB_Client_ADDR" - MB_DATA_ADDR
            %MW102
     "MB_Client_LEN" — MB_DATA_LEN

                      "MB_Client_

# OUT1 — Data".data[0]
                                                                   "MB_Client_

# OUT1 — Data".data[1]
```

Download the PLC program to the PLC after the program has been written completely. Set VFD function codes such as P00.01=2, P00.02=0, P00.06=8, P14.00=2, P16.02–P16.05=192.168.0.2, and keep default values of P16.06–P16.13. Then, you can use the I0.0 input terminal to control the VFD to start and stop at 50.00Hz through ModbusTCP protocol.
